## **Appendix D – MDNR Inspection Reports**

**MISSOURI**  
DEPARTMENT OF  
NATURAL RESOURCES

Michael L. Parson  
Governor

Dru Buntin  
Director

September 7, 2023

David Kennedy, City Manager  
City of Neosho  
203 East Main Street  
Neosho, MO 64850

**UNSATISFACTORY FINDINGS  
RESPONSE REQUIRED**

Dear David Kennedy:

On July 19, 2023, a team member from the Missouri Department of Natural Resources conducted an inspection of the Neosho Wastewater Treatment Plant, located on Old Scenic Drive 0.1 miles north of the Jefferson Avenue intersection, Neosho in Newton County. The entity operates under the authority of Missouri State Operating Permit MO0104906.

Compliance with Missouri Clean Water Law was evaluated. The enclosed report is being issued with Unsatisfactory Findings for the violations identified.

Please refer to the enclosed report for details on the findings and required actions. **A written response documenting actions taken to correct the violations is required by the date specified in the report.**

Fact sheets are available on the Department's website to assist entities with understanding and following environmental requirements.

If you have any questions or would like to schedule a time to meet with a Department team member to discuss compliance requirements, please contact Joshua Grosvenor, EI, by calling 417-891-4300, by email at [SWRO@dnr.mo.gov](mailto:SWRO@dnr.mo.gov), or via mail at Southwest Regional Office, 2040 W. Woodland, Springfield, Missouri 65807-5912.

Sincerely,

SOUTHWEST REGIONAL OFFICE -

**Randall Willoughby, CHMM**  
Water Pollution Section Chief

RDW/jgn

Enclosure

# Compliance Summary

**Facility Name: Neosho WWTP**

**Permit Number: MO0104906**

**Inspection Date: July 19, 2023**

**This summary is intended to direct your attention to violations noted during the inspection of your facility.**

## **Violations noted during the inspection:**

1. A review of the Discharge Monitoring Reports (DMRs) from July 2021 to July 2023 shows violations of permitted limitations. Failure to comply with the effluent limits is a violation of the MSOP, MSOP MO0104906, Missouri Clean Water Law Sections 644.051.1(3) and 644.076.1, RSMo and Missouri Clean Water Commission Regulation 10 CSR 20-7.015.
2. An effluent sample collected by a Department team member on January 11, 2023, revealed a violation of permitted effluent limits as shown in the table in the Sampling and Monitoring Section of the Report. Failure to comply with permitted effluent limits is a violation of Missouri Clean Water Law Sections 644.051.1(3) and 644.076.1, RSMo, and Missouri Clean Water Commission Regulation 10 CSR 20-7.015.

## **Actions necessary to return to compliance:**

1. You have provided a comment during the submittal of the eDMR for the exceedances that addressed the required response.
2. Submit a written response detailing actions to prevent any future occurrences.

Refer to the Unsatisfactory Findings section on pages 4 through 5 of the enclosed report for detailed information about these violations and how to correct them so your facility may be returned to compliance.

**We appreciate your prompt attention to these issues. If you have any questions, or if you would like to meet to discuss these violations further, please contact Joshua Grosvenor, EI, at our Southwest Regional Office at (417)891-4300 or at [swro@dnr.mo.gov](mailto:swro@dnr.mo.gov).**

**Missouri Department of Natural Resources  
Southwest Regional Office  
Report of Inspection  
Neosho WWTP  
Newton County  
MO0104906  
September 7, 2023**

## **Introduction**

On July 19, 2023, a routine compliance inspection of the Neosho WWTP in Newton County, Missouri was conducted by the Missouri Department of Natural Resources. The purpose of this inspection was to determine compliance with the Missouri State Operating Permit (MSOP) MO0104906, the Missouri Clean Water Commission Regulations, and the Missouri Clean Water Law. This report presents the findings and observations made during the compliance inspection. Authority for this inspection is provided in Missouri Clean Water Law 644.026.1(21), RSMo. The following participants were present during the inspection:

### Neosho WWTP

Ken Brady, Local Manager, Alliance Water Resources

Jerry Humphrey, Pretreatment Inspector, Alliance Water Resources

### Missouri Department of Natural Resources

Joshua Grosvenor, EI, Environmental Engineer

## **Entity Description and History**

The wastewater treatment facility is owned by the City of Neosho, located at 203 East Main Street. The City contracts with Alliance Water Resources, Inc., to operate the WWTP. The facility is composed of two separate facilities that were previously permitted separately, Neosho Crowder WWTP and Neosho Shoal Creek WWTP. All effluent from the Neosho Crowder WWTP is sent to the Neosho Shoal Creek WWTP, where flows are combined prior to ultraviolet disinfection. The Neosho Crowder WWTP consists of flow equalization, bar screen, pre-aeration basins, primary clarifiers, trickling filters, recirculation basin, secondary clarification, and aerobic sludge digesters. The Neosho Shoal Creek WWTP consists of flow equalization, bar screen, oxidation ditches, aerobic sludge digesters, aerated sludge holding, and ultraviolet disinfection. The system has a design flow capacity of six million gallons per day. Sludge is land applied. The collection system is composed of approximately six miles of force main, 120 miles of gravity mains, six lift stations, and 2,500 manholes. The discharge from this facility flows into Shoal Creek classified as a gaining setting. The discharge is located in the Spring Basin (11070207) HUC 8 watershed. The facility has a design population equivalent of 59,000. The facility is required to have a Class (A) operator. The UTM 83 coordinates for this facility's outfall are E 377523, N 4084102. The MSOP MO0104906 was last issued on May 1, 2017, and expired on April 30, 2022. An application for renewal has been received by the Department and is in the process of being renewed.

Our records indicate that the Department conducted the previous inspection of this facility on August 21, 2019. The previous inspection listed effluent limitation violations, failure to provide proper notification of violations, missing limit parameters, failure to provide properly signed I&I and sludge reports, operation and maintenance issues, failure to implement a Stormwater Pollution Prevention Plan, and failure to conform to required analytical and sampling methods failure to report a bypass. A Letter of Warning (LOW) was issued for the documented violations.

Sufficient responses were received on September 30 and October 10, 2019, and the facility was returned to compliance on November 25, 2019.

During the office portion of the inspection, I reviewed the facility's file and Department records. The facility is current on their annual permit fee. I reviewed the facility's Form S Annual Sludge Report and Discharge Monitoring Reports (DMRs). The previous year's Annual Sludge Report was received by the Department on February 1, 2023, prior to the February 19<sup>th</sup> deadline.

I conducted a review of the facility's DMRs submitted to this office from July 2021 to July 2023 reflect overall compliance with MSOP limits and reporting requirements. The facility submits DMRs through the Department's Electronic Discharge Monitoring Report (eDMR) system. The following tables include the effluent limit exceedances that occurred during this period:

| Outfall #001  |                            |                                                     |                 |
|---------------|----------------------------|-----------------------------------------------------|-----------------|
| REPORT PERIOD | PARAMETER                  | MSOP LIMIT                                          | REPORTED RESULT |

| December 2022                  | TSS, Percent Removal               | 85% Monthly Average<br>Minimum | 71%             |

| Internal Monitoring Point #IP3 |                  |                                                   |                 |
|--------------------------------|------------------|---------------------------------------------------|-----------------|
| REPORT PERIOD                  | PARAMETER        | MSOP LIMIT                                        | REPORTED RESULT |
| January 2023                   | BOD <sub>5</sub> | 65 mg/L Weekly Average<br>45 mg/L Monthly Average | 111 mg/L        |

### Discussion of Inspection and Observations

The inspection was conducted during normal business hours. I contacted Ken Brady on July 11, 2023, to provide notification of the inspection to ensure timely access to the site.

I arrived at the facility at approximately 9:00 a.m., and met with Ken Brady and Jerry Humphrey, and outlined the statutory authority, purpose, and scope of the inspection. I was granted permission to access the site and was accompanied throughout the tour of the facility.

The laboratory procedures and operational tests were reviewed. The City had a quality assurance and quality control (QA/QC) program for the laboratory and applicable equipment is recertified annually.

We discussed any sanitary sewer overflows (SSO) in the collection system and bypasses at the treatment facility for the last two years. The City has reported three (3) SSOs in 2023, four (4) SSOs in 2022, and three (3) SSOs in 2021. The City had no reported bypasses at the treatment facility during the reviewed time period. The occurrences were all attributed to heavy rainfall events.

A review of the submitted annual inflow and infiltration (I&I) report, for the year 2022, indicated the City observed a total of 206 manholes and rehabbed one (1) brick manhole. A total of 2,100 feet of collection line was smoke tested, 7,599 feet were inspected by Closed-Circuit Television (CCTV) with 43,880 feet cleaned. The City has adopted a program for the maintenance and repair of the collection system as required.

I reviewed copies of their laboratory analysis records and compared those records to the data submitted by the facility to the Department. I did not observe any discrepancies in the records.

We conducted a tour of the Neosho WWTP. We began at the receiving station for hauled wastewater (Photo 1), all wastes that are hauled to the facility enter at this point. I observed the sludge/wastewater holding tank (Photo 2). Flow then passes through the bar screen (Photo 3). The rotors in the oxidation ditches were operational and appeared to be providing adequate mixing (Photos 4 & 5). One of the two final clarifiers was in operation (Photos 6 & 7), and the second final clarifier was drained and awaiting routine maintenance (Photos 8 & 9). Flow is measured with a Parshall flume and flow transducer (Photo 10). The combined flows are treated with ultraviolet disinfection (Photo 11), and the treatment tanks were operational at the time of inspection.

The sludge holding tanks are located west of the treatment facility (Photo 12). Pump trucks connect and pull from a transfer structure (Photo 13). The outfall is marked as required (Photo 14). The receiving stream (Photo 15), did not appear to be impacted from the discharge.

I then observed the eight million gallon peak flow basin (Photos 16 & 17). Water from this basin is pumped to the treatment facility via a connected pump station (Photo 18). The peak flow pump station has a generator backup that is exercised regularly (Photo 19).

I observed the Jay Drive lift station (Photos 20 - 22), the lift station is surrounded by a security fence and has an audio/visual alarm system. The Jay Drive lift station appeared to have an accumulation of debris that needs to be removed. I then observed the Quince Road lift station (Photos 23-25), the lift station is surrounded by a security fence and has an audio/visual alarm

system. All lift stations in the collection system are visually inspected daily and a log is kept at each lift station (Photo 26). I then observed a manhole located near the intersection of S Neosho Boulevard and W South Street (Photos 27 & 28), this manhole has the most SSO issues. Since 2021 there have been five (5) reported SSOs at this manhole location. It was stated that the interceptor line downstream of this manhole will fill during high rainfall events and cause flows to back up and overflow. The City is currently in the process of correcting this issue. It was stated that the collection system downstream of the manhole will have a higher flow during times of high I&I and cause the system to back up out of this manhole.

I conducted an exit meeting with Ken Brady and Jerry Humphrey and outlined the preliminary findings. I explained the observations and any associated violations. I also provided recommendations on returning any violations to compliance. The recommendations are in the section below. I thanked Brady and Humphrey for their time and cooperation and departed the facility at 2:00 p.m.

### Sampling and Monitoring

The Department's Environmental Services Program (ESP) team members conducted compliance sampling at the WWTF on January 10-11, 2023. The attached sample results reflect non-compliance with the effluent limits set forth in the MSOP, MO0104906. The following table includes the effluent limit exceedances that occurred during this sampling event:

| Internal Monitoring Point #IP3 |                                                   |                 |
|--------------------------------|---------------------------------------------------|-----------------|
| PARAMETER                      | MSOP LIMIT                                        | REPORTED RESULT |
| BOD <sub>5</sub>               | 65 mg/L Weekly Average<br>45 mg/L Monthly Average | 164 mg/L        |

### Compliance Determination, Violations, and Required Actions

Based on observations made at the time of the inspection, the facility was found to be out of compliance with the Missouri Clean Water Law, its implementing regulations, and MSOP MO0104906.

### Unsatisfactory Findings

Please submit your responses to the following violations **by October 10, 2023**, to the Southwest Regional Office, 2040 W. Woodland, Springfield, MO 65807.

1. A review of the Discharge Monitoring Reports (DMRs) from July 2021 to July 2023 shows violations of permitted limitations. Failure to comply with the effluent limits is a violation of the MSOP, MSOP MO0104906, Missouri Clean Water Law Sections 644.051.1(3) and 644.076.1, RSMo and Missouri Clean Water Commission Regulation 10 CSR 20-7.015.

**REQUIRED ACTION:** You have provided a comment during the submittal of the eDMR that addressed the required response.

2. An effluent sample collected by a Department team member on January 11, 2023, revealed a violation of permitted effluent limits as shown in the table in the Sampling and Monitoring Section of the Report. Failure to comply with permitted effluent limits is a violation of Missouri Clean Water Law Sections 644.051.1(3) and 644.076.1, RSMo, and Missouri Clean Water Commission Regulation 10 CSR 20-7.015.

**REQUIRED ACTION:** Submit a written response detailing actions to prevent any future occurrences.

### **Recommendations**

Please continue to evaluate and repair the collection system to reduce the inflow and infiltration.

The city is reminded to notify the department of all SSOs and bypasses within 24 hours and submit a written report within five (5) business days of the time the city becomes aware of an SSO or bypass as required in MSOP, MO0094854, Special Condition 12 and Standard Condition Part I, Section B. Bypasses and SSOs are to be reported to the department's Southwest Regional Office during normal business hours or by using the online SSOs and Bypass website at <http://dnr.mo.gov/modnrcag/> or the Environmental Emergency Response hotline at 573-634-2436 outside of normal business hours.

## **1.0 EXECUTIVE SUMMARY**

The City of Neosho is a community of approximately 12,590 people. The City operates two wastewater treatment plants (WWTPs) under Missouri State Operating Permit Number MO-0104906. The main facility is the Shoal Creek WWTP which discharges into Shoal Creek and is the focus of this evaluation. The second facility is the Crowder WWTF which pumps effluent to the Shoal Creek Plant to combine with the Shoal Creek Plant's effluent and then pass through the UV structure for disinfection before discharging to Shoal Creek. The most recent major improvements to the Shoal Creek Plant occurred in the late-2000s with much of the facility being original from the 1980's. Consequently, much of the equipment at the Shoal Creek Plant is older and nearing the end of its useful life.

In order to not only address the immediate needs of the Shoal Creek Plant but also assess its future needs, an evaluation of the facilities was undertaken. The needs of the Shoal Creek Plant were evaluated based on two different scenarios. The first is where the Shoal Creek Plant and the Crowder Plant remain separate as they are now. As such, improvements to the Shoal Creek Plant would only consider conditions representative of the Plant treating the same portion of the City's flow as it does now with Crowder treating the rest. The second scenario considers the Shoal Creek Plant treating wastewater from Crowder and the Crowder Plant being taken out of service. For each scenario, various improvements were evaluated and categorized as either high, medium, or low priority. The priority of an improvement is based on its importance for ensuring adequate treatment capacity as well as proper operation of the Shoal Creek Plant for the future.

Considering keeping the two plants separate, the existing treatment facilities at the Shoal Creek WWTP require various improvements to allow for continued reliable and effective operation. While some components do not have adequate capacity for current or future design conditions, such as the pumping capacity of the raw sewage pumps or the oxygen supply capacity of the rotors, the main issue with the existing facilities is simply their age. Nearly all equipment has greatly surpassed the end of its useful life. As such, constant maintenance and repair of the system is required, beyond what should be expected for a properly functioning system.

To address these issues at the Shoal Creek Plant, it is recommended that the improvements identified as being a high priority be pursued at a minimum. This will allow for improved operation and decreased maintenance for the facilities and allow them to meet projected demands for the foreseeable future. Table 9-1 provides a total project cost estimate for these improvements. The construction cost is estimated to be \$5,390,000 with the total project cost, considering additional costs such as engineering, estimated to be \$7,269,885.

The existing facilities at the Crowder WWTP are also in need of improvements, though a detailed evaluation of these facilities was outside the scope of this report. Considering the age and general condition of the plant, based on observations and discussions with plant personnel, it is likely that the necessary improvements will be just as extensive and costly, if not more so, than what would be involved in constructing new facilities at the Shoal Creek Plant. For this reason, it is thought that funds for such improvements would be better spent to consolidate the City's treatment facilities into a single plant. This would require that additional facilities be constructed at the Shoal Creek Plant. Not only would this reduce overall operation and maintenance for the treatment facilities, but it would also provide the City with brand-new and up-to-date facilities instead of trying to retrofit new equipment into an existing system of a dated design.

Should the City wish to consolidate treatment facilities, further improvements will be required in addition to those recommended for the Shoal Creek Plant alone. Mainly, this includes the construction of an additional treatment train to allow for increased treatment capacity along with various other improvements. Table 9-2 provides a cost estimate for all improvements necessary for the Crowder Plant to be taken offline and the Shoal Creek Plant to treat all wastewater for the City of Neosho. For these improvements, the estimated construction cost is \$17,536,705 with the total project cost being estimated at \$22,778,255.

Finally, the City of Neosho will be required to comply with 10 CSR 20-7.015 Effluent Regulations by January 1, 2033. This will require that phosphorus levels from plant effluent be consistently below 1.0 mg/L. In order to have adequate data available for determining the necessary improvements needed to achieve compliance, it is recommended that the City continue to sample phosphorus effluent levels and start sampling influent phosphorus levels.

## **2.0 INTRODUCTION**

### **2.1 Background**

The City of Neosho operates a sewage collection system and two mechanical wastewater treatment plants under the Missouri State Operating Permit No. MO-0104906, a copy of which is included in Appendix A of this report. The permit establishes limits for the discharge of treated wastewater and disposal of sludge from the City's treatment facilities. The last evaluation of the wastewater collection and treatment facilities was conducted in 2007, with the last improvements implemented at the Shoal Creek Plant dating back to 2009.

The continuing authority for the wastewater treatment facilities is the City of Neosho. City Hall is located at 203 East Main Street, Neosho, MO 64850, and can be reached at 417-451-8050. Alliance Water Resources is contracted by the City to operate the City's water and wastewater systems, including the treatment facilities. For the Shoal Creek Plant, Jerry Humphrey is the certified operator (certification number 10405) and contact person. The phone number for the Shoal Creek Plant is 417-451-8075.

### **2.2 Scope**

The following report is intended to provide the City of Neosho with recommendations for their Shoal Creek Wastewater Treatment Plant to meet the City's wastewater needs for the next twenty years. As a part of this plan, data was compiled to establish design conditions for the City's wastewater treatment plant in the year 2043. Population growth projections were utilized in conjunction with data relative to existing wastewater flows and loads to establish design criteria. A limited infiltration/inflow analysis is presented to evaluate the adequacy of existing and proposed facilities to handle wet weather flows. It should be noted that, since the focus of this study is on Shoal Creek WWTP, the evaluation does not include the facilities at the Crowder WWTP. Aspects of the Crowder Plant discussed in this report are done only as needed in order to evaluate their impact on the Shoal Creek Plant.

Plans are presented to improve the Shoal Creek Plant to meet future demands, and cost estimates are provided for the described work. Finally, funding options are reviewed to provide the City with information relative to the financial impact of the expansion project on system users.

### **3.0 GENERAL INFORMATION**

#### **3.1 Location**

The City of Neosho is located in Newton County, Missouri, serving as the county seat. Neosho is located approximately 11 miles east of Seneca and approximately 20 miles south of Joplin.

#### **3.2 Population**

At the time of the 2010 census, the City's population was 11,835; the population in 2020 was 12,590. Neosho is comprised of mainly residential dwellings and commercial establishments, with only a few industrial users.

#### **3.3 Economics**

In 2010, the median household income was approximately \$32,488, based on the census data current at the time. Considering 2020 census data, the current median household income is approximately \$43,925. The low-income and moderate-income percentage (LMI) is 47.46%, based on data for 2015.

#### **3.4 Environmental**

##### ***3.4.1 Topography and Geology***

The City of Neosho's Shoal Creek WWTP is located in Section 13, Township 25 N, Range 32 W in Newton County, Missouri, and Outfall #001 into Shoal Creek is located north of the facility in Section 12, Township 25 N, Range 32 W. Neosho is located within the Ozark Plateaus, which are major structural features of the area. As can be seen in the topographic map shown in Figure 3-1, the City lies in a valley between gently rolling hills and ridges with Shoal Creek flowing north towards Joplin from the north end of the City. Hickory Creek runs along the east end of the City. The elevation varies from approximately 980 ft near Outfall #001 to Shoal Creek, located towards the north end of the City, to about 1290 ft near Crowder College at the south end of the City.

**Figure 3-1. Map of Neosho, Missouri Area**

### 3.4.2 Climate

The average annual precipitation for the area around Neosho is approximately 51.70 inches. The monthly precipitation averages for the area are given as follows:

**Table 3-1. Precipitation Data**

| Month    | Precipitation (in.) | Month     | Precipitation (in.) |
|----------|---------------------|-----------|---------------------|
| January  | 4.13                | July      | 5.11                |
| February | 3.44                | August    | 2.85                |
| March    | 5.89                | September | 2.25                |
| April    | 4.57                | October   | 5.88                |
| May      | 9.98                | November  | 3.11                |
| June     | 3.29                | December  | 2.08                |

*Source: <https://www.weather.gov/>. 2000-2022 Average Precipitation.*

The majority of the precipitation occurs during the spring, summer, and fall months, with the winter months being relatively dry. The spring, summer, and fall precipitation usually comes in the form of showers or thunderstorms. Most of the winter precipitation is rain, freezing rain, or short-lived snow cover rarely lasting more than a few days.

The temperature is relatively mild in the area, however sudden temperature changes are common. Generally, winters are cold, and summers are hot, however prolonged periods of either extreme are rare. Periods of cool, dry weather occur during the predominantly hot, humid summers, and periods of mild, above-freezing temperatures occur during the cold, dry winters. The average winter temperature will not typically fall below zero, however when it does occur, it is usually on only one or two days per year. The first freeze at the average elevations in the planning area normally occurs in the last week of October, while the last freeze normally occurs in the middle of April.

### 3.4.3 Receiving Stream

The combined effluent from the Shoal Creek and Crowder wastewater treatment facilities flows from the outfall structure, discharging into Shoal Creek, as shown in Figure 3-3. Shoal Creek is listed on the 303(d) list for E. Coli and zinc and is a Class “P” stream, which indicates that it is a stream that maintains permanent pools that support aquatic life.

### **3.5 Wastewater Facilities**

The City of Neosho operates and maintains a wastewater collection system and two mechanical treatment plants. As indicated previously, the scope of this report is the evaluation of the Shoal Creek WWTP and excludes evaluations of the Crowder WWTP and the overall collection system beyond their immediate impacts on the Shoal Creek Plant, though general information pertaining to these facilities is provided in this section.

#### **3.5.1 Wastewater Collection System**

The existing public collection system consists of approximately 348,580 lineal feet of gravity sewer and 42,320 lineal feet of pressure sewer.

#### **3.5.2 Crowder Wastewater Treatment Plant**

The Crowder WWTP was previously permitted independently from the Shoal Creek WWTP under permit number MO-0039926. This facility consists of two flow equalization basins, a bar screen, two pre-aeration basins, two primary clarifiers, three trickling filters, a recirculation basin, three secondary clarifiers, chlorine disinfection, a chlorine contact basin, dechlorination, two primary aerobic sludge digesters, and a sludge drying bed.

The facility is designed to treat 3 MGD and the sludge produced in treatment is hauled off and land applied. The design sludge production of the facility is approximately 812 dry tons/year per the current operating permit. The Crowder WWTP discharges to the ultraviolet disinfection system located at the Shoal Creek WWTP via a lift station located at the tail end of the Crowder Plant. Combined effluent is then discharged into Shoal Creek.

While this report does not include an evaluation of the Crowder Plant, considerations must be given as to the facility's impact on the Shoal Creek Plant for both current and future conditions. As such, an observational site visit of the Crowder Plant was conducted to discuss the operations and needs of the facility in general terms. Based on this visit, it appears that significant improvements to the existing facilities are needed to allow the plant to continue to function properly into the foreseeable future. The facilities needed to convey wastewater from Crowder to the Shoal Creek Plant already exist. As such, it likely makes more sense from an economic and operational standpoint to consider treating flows from the Crowder Plant in improvement alternatives to the Shoal Creek Plant rather than pursuing major improvements to the Crowder Plant. Figure 3-2 provides a layout of the Crowder Wastewater Treatment Plant.

### **3.5.3 Shoal Creek Wastewater Treatment Plant**

Neosho's Shoal Creek Wastewater Treatment Plant is an extended aeration (oxidation ditch) mechanical plant that discharges into Shoal Creek. The facility is designed to treat an average flow of 3 MGD, though plant personnel indicate that it can handle up to 6.0 MGD. The plant has a design sludge production capacity of approximately 630 dry tons per year, according to the operating permit. Ultraviolet disinfection is provided to meet seasonal E. coli limits. The most recent major upgrades to the Neosho Shoal Creek WWTP occurred in the late-2000s with the construction of the flow equalization basin. This facility includes a flow equalization basin, a bar screen, two oxidation ditches, two secondary clarifiers, ultraviolet disinfection, an aerobic sludge digester, and sludge holding basins. Biosolids are land applied.

Figure 3-3 shows the layout of the existing facilities at the Shoal Creek Wastewater Treatment Plant.

## **4.0 INFLUENT, EFFLUENT, AND INSTREAM LIMITATIONS**

### **4.1 Summary of Receiving Water Quality**

Neosho's Shoal Creek Wastewater Treatment Plant discharges into Shoal Creek. Shoal Creek is a Class "P" stream, which indicates that it is a stream that maintains permanent pools that support aquatic life. Shoal Creek is a 303(d) listed stream for *E. coli* and zinc.

Missouri Water Quality Standards indicate that Shoal Creek has nine beneficial use designations, including protection of aquatic life, warm-water habitat, cool-water habitat, drinking water supply, industrial water supply, human health protection as it relates to the consumption of fish, irrigation for use on crops utilized for human or livestock consumption, livestock and wildlife protection, secondary contact recreation, and whole-body contact recreation that supports swimming.

### **4.2 Permit Requirements**

As stated previously, both the Shoal Creek and Crowder wastewater treatment plants operate under the same permit given that the Crowder Plant's discharge mixes with the Shoal Creek Plant's effluent under normal conditions. The combined effluent shares a common outfall located at the Shoal Creek Plant. However, the Crowder Plant does have two other outfalls that are permitted for discharge. For this reason, five internal monitoring points are also included in the permit to act as defined locations for data collection as well as to function as points with effluent limitations and monitoring requirements of their own. The following sections discuss these requirements in greater detail for each of the locations outlined in the permit. The current operating permit expired as of April 30, 2022.

#### **4.2.1 Influent Monitoring Requirements**

The City's operating permit establishes influent monitoring requirements for 5-day biochemical oxygen demand (BOD<sub>5</sub>) and total suspended solids (TSS) requiring the monthly average concentrations to be reported in order to determine removal efficiency for these constituents at each plant. Internal Monitoring Point 1 (#IP1) is located at the influent of the Crowder WWTP, shown in Figure 3-2. Internal Monitoring Point 4 (#IP4) is located at the influent of the Shoal Creek WWTP, shown in Figure 3-3.

#### **4.2.2      *Current Effluent Limitations and Monitoring Requirements***

The City's current operating permit establishes criteria for the required quality of effluent from the wastewater treatment process, as well as procedures for disposal of the waste solids (sludge). Current effluent limits are based on an average plant design flow of 3,000,000 gallons per day (GPD) for the Crowder WWTP and 3,000,000 gallons per day (GPD) for the Shoal Creek WWTP. Each plant has at least one monitoring point that is specific to that facility with Outfall #1 being the point of discharge to Shoal Creek of the combined flow from both facilities. The location of this outfall is shown in Figure 3-3.

Outfall #002, Outfall #003, Internal Monitoring Point 2 (#IP2), and Internal Monitoring Point 3 (#IP3) are specific to the Crowder WWTF. Outfall #002 is the original point of discharge from the facility to a tributary of Buffalo Creek. While the Crowder Facility can meet the limits established for this outfall, normal operations do not see a discharge at this point as flow is sent to the Shoal Creek Plant. Outfall #003 is the discharge point to the golf course irrigation storage ponds while #IP2 represents the point of discharge from the last storage pond. City personnel have indicated that the piping that allows the Crowder Plant to send flow to the golf course storage ponds has been removed. Therefore, discharge to and from the storage ponds is not currently possible. Considering this, and that none of these three locations impact the Shoal Creek Plant in any way, these locations will not be discussed further in this evaluation.

Internal Monitoring Point 3 is the location where effluent monitoring for flow sent from the Crowder Plant to the Shoal Creek Plant occurs and serves as the primary basis for effluent limits and monitoring requirements for the Crowder Plant. Considering that effluent at this location impacts the Shoal Creek Plant, this monitoring location must be accounted for in this evaluation. Figure 3-2 shows the location of Outfall #002, Outfall #003, #IP2, and #IP3.

Finally, Internal Monitoring Point 5 (#IP5) is the point at which effluent from the Shoal Creek Plant is monitored before mixing with effluent from the Crowder Plant. Figure 3-3 shows the location of this monitoring point.

Full values and requirements for effluent limitations and monitoring for all outfalls and internal monitoring points can be found in the NDPES permit in Appendix A. Table 4-1 provides the effluent limits applicable to Outfall #001, #IP3, and #IP5 as they are pertinent to the evaluation of the Shoal Creek Plant.

**Table 4-1. Current Effluent Limitations and Monitoring Requirements**

| Location     | Effluent Parameter            | Units   | Limitations |             |              |
|--------------|-------------------------------|---------|-------------|-------------|--------------|
|              |                               |         | Daily Max   | Weekly Avg. | Monthly Avg. |
| Outfall #001 | Ammonia as N (Apr 1 - Sep 30) | mg/L    | 6.1         | -           | 1.2          |
|              | Ammonia as N (Oct 1 - Mar 31) | mg/L    | 11.9        | -           | 2.2          |
|              | E. coli (Apr 1 - Oct 31)      | #/100mL | -           | 630         | 126          |
|              | Oil & Grease                  | mg/L    | 15          | -           | 10           |
|              | Phenol                        | ug/l    | 4200.5      | -           | -            |
|              | Cadmium, Total Recoverable    | ug/l    | 0.6         | -           | 0.3          |
|              | Iron, Total Recoverable       | ug/l    | 1849.6      | -           | 702.5        |
|              | Selenium                      | ug/l    | 9.2         | -           | 3.2          |
| #IP3         | BOD <sub>5</sub>              | mg/L    | -           | 65          | 45           |
|              | Total Suspended Solids        | mg/L    | -           | 65          | 45           |
| #IP5         | BOD <sub>5</sub>              | mg/L    | -           | 45          | 30           |
|              | Total Suspended Solids        | mg/L    | -           | 45          | 30           |

#### **4.2.3      *Future Effluent Limitations and Monitoring Requirements***

Recent revisions to 10 CSR 20-7.015 Effluent Regulations, which became effective on October 30, 2023, establish phosphorus effluent limitations for applicable treatment facilities. Among the impacted facilities are those that have a design flow greater than or equal to 1 million gallons per day. Under this condition, both of Neosho's treatment plants are affected by this regulation. In general, the new regulations will require that discharged phosphorus levels are consistently below 1.0 mg/L and that the percent removal of phosphorus from influent to effluent is at least 75%. Compliance must be achieved by January 1, 2033.

Reviewing Daily Monitoring Report data from January 2020 to December 2022, effluent from Outfall #001 had an average P concentration of 1.36 mg/L with a maximum value of 1.8 mg/L and a minimum of 0.16 mg/L. While the average value is over the proposed limit of 1.0 mg/L, compliance will likely be able to be achieved without drastic modifications to the facilities, assuming the data available is an accurate depiction of typical conditions. Continuing to sample phosphorus effluent levels will be important to ensure adequate data is available for verifying discharge concentrations. Further, it is recommended that influent phosphorus sampling be conducted at both plants as well in order to determine influent phosphorus loadings. This data will be important in calculating percent removal as well as helping determine the improvements necessary for meeting effluent requirements.

Phosphorus removal can be achieved chemically or biologically. The likely first step is to adjust operations to try to achieve as much biological removal as possible. Considering it is nearly 10 years until compliance with the new regulation is required, there is time to monitor results and further adjust operations to assess how confident the City is with being able to consistently meet P effluent levels of less than 1.0 mg/L. It is recommended that this process begin in the near future. If the proposed P limit is not able to be met biologically, then an evaluation of additional improvements will need to occur.

#### **4.2.4      *Instream Monitoring Requirements***

The City's operating establishes instream monitoring requirements on a quarterly basis for both upstream of Outfall #001 (#SM1) and downstream of Outfall #001 (#SM2). The permit and monitoring requirements can be found in Appendix A.

## **5.0 WASTEWATER FLOWS AND LOADS**

### **5.1 Current Conditions**

#### **5.1.1 Source**

The City of Neosho supplies all its own water from a combination of surface water (approximately 73%) and groundwater (approximately 27%). The primary sources of wastewater for the Shoal Creek WWTF are residential and commercial users, though industrial users contribute flow into the Crowder system which then passes through the UV structure. No permitted industrial users currently discharge directly to the Shoal Creek system. However, flow from the Crowder plant can be routed directly into the Shoal Creek facilities.

#### **5.1.2 Hydraulic Loading**

A key aspect in evaluating any existing treatment facility is establishing a solid basis for existing wastewater flows. Utilizing data from monthly Discharge Monitoring Reports (DMRs) is typically the best means of acquiring accurate flow data. For this report, DMR data from January 2020 to December 2022 was compiled and evaluated. Considering that flow from the Crowder Plant is sent to the ultraviolet disinfection process at the Shoal Creek Plant and can be routed through the Shoal Creek facility as well, flows from both facilities must be accounted for when evaluating the Shoal Creek Plant. From this data, the total flow being discharged from each facility was evaluated, which therefore includes not only flow from residential, commercial, and industrial sources but also extraneous water that enters the system as I&I as well.

For the Crowder Plant, DMR flow data for 2020 through 2022 was not available. City personnel indicate that the average daily flow at the Crowder Plant is approximately 600,000 gpd with peak flows reaching approximately 5.0 MGD. While current flow data is not available, flow values from 2013 and 2014 indicate an average daily flow of 900,000 and a peak of 4.3 MGD. To be conservative, 900,000 gpd will be used as the existing average daily flow while 5.0 MGD will be used for the current peak flow rate. These two values yield a peaking factor of 5.6. Using the equation from the MDNR Minimum Design Standards,  $PF = (18 + \sqrt{P}) / (4 + \sqrt{P})$  where P = population in thousands, the theoretical peaking factor for the City of Neosho would be 2.85. Comparing this theoretical value to the actual peaking factor for the Crowder Plant, the actual value is nearly double that of the theoretical. While this likely indicates high levels of I&I are affecting the Crowder basin, a peaking factor of 5.6 is not unusual.

Flow data for the Shoal Creek Plant is based on data collected at Internal Monitoring Point 5. From this information, the average dry weather flow is approximately 2.2 MGD with the average monthly flow being approximately 3.2 MGD throughout the wettest part of the year. The overall average flow for the facility is 2.4 MGD. Considering a peak flow of 5.5 MGD compared to the average monthly flow yields a peaking factor of 2.3. Comparing this value to the previously calculated theoretical value of 2.85 shows that peak flows experienced at the Shoal Creek Plant appear to be slightly lower than what would be estimated. Wastewater treatment plant flows for the Shoal Creek facility from January 2020 through December 2022 are summarized in Appendix B.

As stated, there is the potential for Crowder flows to be routed through the Shoal Creek Plant. As such, consideration should be given to this condition as it relates to the capacity of the Shoal Creek Plant when planning for the future. Combining the average daily flows from both the Crowder and Shoal Creek Plants produces an average daily wastewater flow of 3.3 MGD. Comparing this value to the current population of 12,590 yields an average per capita flow of approximately 262 gpcd. This value, when compared to an average value of 100 gpcd is 2.62 times higher than the anticipated daily flow.

When considering a combined peak flow, both peak values could be totaled to yield a potential peak flow of 10.5 MGD. Given this assumes that peak flows in both systems occur on the same day, this value is likely somewhat conservative. However, this peak flow is not necessarily unreasonable for a peak inflow value for both systems. Current flow data for both the Shoal Creek Plant and the Crowder Plant is summarized in Table 5-1.

**Table 5-1. Shoal Creek and Crowder Plant Current Flows**

|                        | <b>Crowder</b> | <b>Shoal Creek</b> | <b>Shoal Creek and Crowder</b> |
|------------------------|----------------|--------------------|--------------------------------|
| <b>Average (MGD)</b>   | 0.9            | 2.4                | 3.3                            |
| <b>Max Month (MGD)</b> | 1.7            | 4.4                | 6.0                            |
| <b>Peak (MGD)</b>      | 5              | 5.5                | 10.5                           |
| <b>Peaking Factor</b>  | 5.6            | 2.3                | 3.2                            |

### 5.1.3 Pollutant Loading

Influent BOD<sub>5</sub> and total suspended solids are measured for percentage removal calculations only. No other constituents are required to be measured for the influent according to the MSOP. Samples for the Crowder Plant are taken at Internal Monitoring Point 1 and samples for the Shoal Creek Plant are collected at Internal Monitoring Point 4. DMR data analyzed includes results from once-weekly effluent and influent grab samples to calculate removal efficiency. This data includes measurements of BOD<sub>5</sub> and TSS.

Influent BOD<sub>5</sub> and TSS data were combined with corresponding effluent flow measurement data (estimated as being equal to influent flow) to estimate influent loads in lb/day according to the following equation:

$$\text{Influent Loading} \left( \frac{\text{lb}}{\text{day}} \right) = \text{Flow (MGD)} \times \text{Concentration} \left( \frac{\text{mg}}{\text{L}} \right) \times 8.345$$

For the Shoal Creek Plant, corresponding influent concentration data and flow values were available to be able to calculate daily loading values. As indicated, however, such flow data was not available for the Crowder Plant. In order to estimate Crowder daily flow values that correspond to influent concentration readings, it will be assumed that flow ratios between the Shoal Creek and Crowder plants are similar on a daily basis. Based on this assumption, Crowder's daily flow values can be estimated using Shoal Creek's ratio of daily flow to its average flow relative to Crowder's average flow. From these flow values, daily influent concentrations can be used to estimate daily BOD<sub>5</sub> and TSS loadings for the Crowder Plant.

As stated previously, the condition of the Crowder Plant would likely require major improvements to allow it to maintain proper operation going into the future. Considering the existing facilities are available and in use to convey flow from Crowder to Shoal Creek, it is more reasonable to assume that the Shoal Creek Plant will need to be able to treat the raw wastewater from Crowder at the time improvements to Crowder would be pursued. As such, a loading condition for the Shoal Creek Plant that reflects receiving untreated flow from Crowder is a more reasonable condition to plan for instead of continuing to receive treated effluent from the existing Crowder facilities. Based on this, a combined loading condition for Shoal Creek treating raw wastewater from Crowder, assuming no treatment occurs through the existing Crowder facilities, will be a scenario evaluated in this report.

Table 5-2 provides a summary of BOD and TSS influent sampling data from January 2020 to December 2022 along with corresponding influent loads. The raw DMR sampling data and calculated loading values for both plants are provided in Appendix B.

**Table 5-2. Shoal Creek and Crowder Plant Current Loads**

|                           | Shoal Creek      |       | Crowder          |      | Combined         |       |
|---------------------------|------------------|-------|------------------|------|------------------|-------|
|                           | BOD <sub>5</sub> | TSS   | BOD <sub>5</sub> | TSS  | BOD <sub>5</sub> | TSS   |
| <b>Avg. (mg/l)</b>        | 52               | 91    | 444              | 203  | -                | -     |
| <b>Peak (mg/l)</b>        | 630              | 566   | 2420             | 1540 | -                | -     |
| <b>Avg. (lb/day)</b>      | 1260             | 1850  | 2828             | 1399 | 3915             | 3233  |
| <b>Max Month (lb/day)</b> | 5937             | 5885  | 6021             | 4775 | 6809             | 8919  |
| <b>Peak (lb/day)</b>      | 12085            | 13217 | 16281            | 7366 | 17877            | 14873 |

Table 5-3 displays typical constituent concentrations for medium-strength wastewater from Metcalf & Eddy (2014), *Wastewater Engineering Treatment and Reuse*, Fifth Edition. Typically, systems that collect relatively low per-capita flows tend to produce higher-strength wastes, and systems that collect relatively high per-capita flows tend to produce lower-strength wastes.

**Table 5-3. Typical Constituent Concentrations for Municipal Wastewater**

| Item                                                                                                                                                   | Low Strength Wastewater <sup>(1)</sup> | Medium Strength Wastewater <sup>(1)</sup> | High Strength Wastewater <sup>(1)</sup> |
|--------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------|-------------------------------------------|-----------------------------------------|
| Per-capita Flowrate                                                                                                                                    | 150 gal/capita-day                     | 100 gal/capita-day                        | 50 gal/capita-day                       |
| BOD <sub>5</sub>                                                                                                                                       | 133 mg/L                               | 200 mg/L                                  | 400 mg/L                                |
| TSS                                                                                                                                                    | 130 mg/L                               | 195 mg/L                                  | 389 mg/L                                |
| 1. Adapted from <i>Metcalf and Eddy</i> , <i>Wastewater Engineering: Treatment and Resource Recovery</i> , 5 <sup>th</sup> edition (2014), Table 3-18. |                                        |                                           |                                         |

Based on these typical ranges, wastewater at the Shoal Creek Plant tends to be low strength in terms of BOD<sub>5</sub> and TSS while wastewater at the Crowder Plant could be considered to generally be high strength for BOD<sub>5</sub> and TSS. Crowder's influent being higher strength is most likely because the facility receives industrial waste from permitted facilities.

#### **5.1.4 Infiltration/Inflow**

##### **5.1.4.1. Theoretical Wastewater Flows**

Water sales data serves as an indicator of the theoretical wastewater flows that would be anticipated if there were no infiltration/inflow entering the City sewer system. The City of Neosho operates a water treatment facility and provides its own drinking water. Water usage data shows that the City of Neosho sold an average of 1,239,757 gallons per day between residential, commercial, and industrial users from 2020 to 2022. It is typical to assume that wastewater flows would be approximately 80% of water sales if no I&I was present in the system. Using this assumption yields a theoretical wastewater flow of 991,805 gallons per day. The difference between the theoretical and actual wastewater flow most likely represents a rough estimate of the average I&I entering the Neosho system. Table 5-4 provides a comparison of the total theoretical wastewater flow to the average daily flow for both the Shoal Creek and Crowder facilities to produce an estimated average daily I&I flow value.

**Table 5-4. Wastewater Flow Based on Water Usage Data**

| <b>Daily Avg. Water Usage</b> | <b>Estimated Daily Avg. Wastewater*</b> | <b>Actual Daily Avg. Wastewater Flow</b> | <b>Estimated Daily Avg. I&amp;I</b> |
|-------------------------------|-----------------------------------------|------------------------------------------|-------------------------------------|
| 1.240 MGD                     | 0.992 MGD                               | 3.300 MGD                                | 2.308 MGD                           |

\*80% of the Water Usage

##### **5.1.4.2. Cost-Effective Analysis**

“Excessive” I&I is the quantity of infiltration/inflow that can be economically eliminated from a sewer system by rehabilitation, as determined by a cost-effective analysis that compares the costs for I&I correction with total costs for transportation and treatment of I&I.

Based on the information presented in Table 5-4, it can be concluded that 2.308 MGD represents a rough estimate of the additional daily flow entering Neosho’s wastewater system as I&I. This indicates that on average, approximately 30% of flow within the system comes from users (residential, commercial, and industrial) and nearly 70% of the total average daily volume is from infiltration and inflow which enters the system through leaking sewer pipes, manholes, and from the private side of the collection system (service laterals, sump pump connections, foundation drains, etc.).

Inflow and infiltration increase operating and maintenance costs for both the collection and treatment systems. In the collection system, excess flow that cannot make its way to the treatment facilities solely by gravity, is required to be pumped at one point or another. This brings increased

power consumption and wear on the pumping equipment. In conjunction with the increases in power costs and equipment maintenance costs associated with transporting and treating peak flows, additional operator time is required to monitor collection system lift stations, etc. Similarly, additional costs are also incurred at the treatment facilities as the excess flow must also be treated, increasing power consumption, operator time, equipment maintenance, and chemical costs.

Considering that I&I flow has a reduced treatment cost due to lesser organic loadings and that many of the existing facilities within the system would still operate in a similar manner even without I&I, it will be assumed that the cost to treat I&I is 30% of the operating costs. With an average total annual operating cost of \$1,617,445 for the wastewater system, not considering debt service, \$485,233 (30%) can be roughly estimated to be associated with I&I flow. With an estimated 743,570,000 gallons of I&I going through the City's system in a year, the average O&M cost associated with I&I can be estimated as \$0.65 per 1,000 gallons.

#### **5.1.4.3. I&I Findings**

Considering the large portion of the City's flow that is estimated as being I&I, it is recommended that the City pursue efforts at reducing the extraneous flow entering the system. Beyond increased O&M costs, excessive I&I decreases collection and treatment system capacity which necessitates large and costly facility improvements to accommodate these flows. As such, it is prudent to spend the necessary resources now to regain capacity in the existing facilities. This will help prevent costly expansions in the future that serve mainly to convey and treat I&I while still not solving the issue.

Unfortunately, meaningfully reducing I&I within the system is typically costly and is a long-term goal that is generally achieved after years of work. Estimating the amount of I&I reduction relative to the degree of efforts pursued is also simply not feasible. These things considered, it is still necessary to evaluate the needs of the wastewater system based on current and future flows that do not reflect a reduction in I&I. Further, it is not recommended to delay any necessary improvements to existing facilities in the hopes that I&I will be reduced sufficiently and quickly enough to eliminate the need for said improvements. Addressing current and future system needs while also working to reduce I&I are efforts that should be pursued simultaneously. If the City decides to focus on I&I abatement, a detailed flow monitoring, acoustic sounding, and smoke testing campaign would be required to be conducted first.

## 5.2 Future Conditions

### 5.2.1 General

Future conditions must be considered when studying Neosho's wastewater treatment facility. This section will provide estimates of wastewater treatment needs through the year 2043.

### 5.2.2 Population Projections

Recent trends in population growth in Neosho will serve as the primary indicator of future growth patterns, and therefore future wastewater flows. The past six decades were analyzed for future population projections.

**Table 5-5. Census Data**

| Year | Population | Increase<br>or<br>Decrease | Percent<br>Change |
|------|------------|----------------------------|-------------------|
| 1960 | 7,452      | N/A                        | N/A               |
| 1970 | 7,517      | 65                         | 0.9 %             |
| 1980 | 9,493      | 1976                       | 26.3 %            |
| 1990 | 9,254      | -239                       | - 2.5 %           |
| 2000 | 10,505     | 1251                       | 13.5 %            |
| 2010 | 11,835     | 1330                       | 12.7 %            |
| 2020 | 12,590     | 755                        | 6.4 %             |

To propose an improvement program for the future, it is necessary to project the population for the design year of 2043 so that proposed facilities can be designed to accommodate future flows and loads. Four methods of projecting the population were utilized: Arithmetic Projection, Geometric Projection, Average Percent Increase Projections Per Annual Basis, and Average Percent Increase Per Decade Basis. The calculations for the individual projection methods are provided in Appendix C of this report.

Each method has both advantages and disadvantages when projecting the future population. For a community the size of Neosho, the addition of a large housing subdivision or a moderately large industry locating to the area may significantly impact the population growth. Excluding such a factor, it is reasonably accurate to arrive at a composite figure based on the average of the population projections described in Table 5-6.

**Table 5-6. Population Projections**

| Method                                              | Projected Population |
|-----------------------------------------------------|----------------------|
| Arithmetic Projection for 2043                      | 14,560               |
| Geometric Projection for 2043                       | 15,393               |
| Average Annual Percent Increase Projection for 2043 | 15,660               |
| Average Decade Percent Increase Projection for 2043 | 15,523               |
| Average                                             | 15,284               |

The average of the 2043 population projections of 15,284 people will be used for this report. This reflects a population increase of approximately 21% from the current population.

### **5.2.3 Hydraulic Loading**

The population projection indicates an approximately 21% increase in population over the next 20 years. It's reasonably accurate to assume that the increase in average daily wastewater flows will mirror that of the population; especially if the I&I problem is not mitigated. Additionally, it is anticipated that the peaking factor calculated previously will remain applicable.

The projected wastewater flows for both the Crowder and Shoal Creek treatment facilities in the year 2043 are presented in Table 5-7.

**Table 5-7. Shoal Creek and Crowder Plant Projected Flows**

|                        | Crowder | Shoal Creek | Shoal Creek and Crowder |
|------------------------|---------|-------------|-------------------------|
| <b>Average (MGD)</b>   | 1.1     | 2.9         | 4.0                     |
| <b>Max Month (MGD)</b> | 2.1     | 5.3         | 7.3                     |
| <b>Peak (MGD)</b>      | 6.1     | 6.7         | 12.7                    |
| <b>Peaking Factor</b>  | 5.6     | 2.3         | 3.2                     |

#### 5.2.4 Pollutant Loading

As with hydraulic loading, it is reasonable to estimate that the organic loading will increase at a rate that reflects the increase in population. As such, a 21% increase in organic loads in 2043 compared to current loads can be expected. Table 5-8 represents these estimated future load values for the Crowder and Shoal Creek plants.

**Table 5-8. Shoal Creek and Crowder Plant Projected Loads**

|                           | Shoal Creek      |       | Crowder          |      | Combined         |       |
|---------------------------|------------------|-------|------------------|------|------------------|-------|
|                           | BOD <sub>5</sub> | TSS   | BOD <sub>5</sub> | TSS  | BOD <sub>5</sub> | TSS   |
| <b>Avg. (mg/l)</b>        | 52               | 91    | 444              | 203  | -                | -     |
| <b>Peak (mg/l)</b>        | 630              | 566   | 2420             | 1540 | -                | -     |
| <b>Avg. (lb/day)</b>      | 1525             | 2239  | 3422             | 1692 | 4737             | 3912  |
| <b>Max Month (lb/day)</b> | 7183             | 7120  | 7286             | 5778 | 8239             | 10792 |
| <b>Peak (lb/day)</b>      | 14622            | 15993 | 19700            | 8913 | 21631            | 17996 |

## 6.0 WASTEWATER TREATMENT FACILITY DESIGN CRITERIA

### 6.1 Influent Design Criteria

In establishing influent design criteria, current and future conditions as well as the impacts of directing flow from the Crowder Plant through the Shoal Creek Plant for treatment must be considered. This presents four different parameters for evaluating the capacity of existing facilities and alternatives for system improvements. Table 6-1 summarizes information discussed in Section 5.0 to present these four conditions.

**Table 6-1. Shoal Creek Influent Design Conditions**

|                                 | Shoal Creek |                           |              | Shoal Creek and Crowder |                           |              |
|---------------------------------|-------------|---------------------------|--------------|-------------------------|---------------------------|--------------|
|                                 | Flow (MGD)  | BOD <sub>5</sub> (lb/day) | TSS (lb/day) | Flow (MGD)              | BOD <sub>5</sub> (lb/day) | TSS (lb/day) |
| <b>Current (2023) Avg.</b>      | 2.4         | 1260                      | 1850         | 3.3                     | 3915                      | 3233         |
| <b>Current (2023) Max Month</b> | 4.4         | 5937                      | 5885         | 6.0                     | 6809                      | 8919         |
| <b>Current (2023) Peak</b>      | 5.5         | 12085                     | 13217        | 10.5                    | 17877                     | 14873        |
| <b>Future (2043) Avg.</b>       | 2.9         | 1525                      | 2239         | 4.0                     | 4737                      | 3912         |
| <b>Future (2043) Max Month</b>  | 5.3         | 7183                      | 7120         | 7.3                     | 8239                      | 10792        |
| <b>Future (2043) Peak</b>       | 6.7         | 14622                     | 15993        | 12.7                    | 21631                     | 17996        |

### 6.2 Effluent Design Criteria

As described previously, a phosphorus effluent limit of 1.0 mg/L will come into effect on January 1, 2033. Initially, efforts should be made to try to meet this limit biologically. If this cannot be accomplished, further evaluation will be required to reduce phosphorus effluent levels chemically via additional improvements to the treatment facilities.

With no other known limits to be considered for the immediate future, effluent design criteria for both current and future conditions will be the same as those outlined for the Shoal Creek Plant in the existing operating permit. As such, it is also assumed that the current limits for Outfall #001 and the more stringent limits of #IP5 will still apply to effluent from Shoal Creek under the circumstance that flow from the Crowder Plant is sent through Shoal Creek to receive treatment. These design limits are presented in Table 6-2.

**Table 6-2. Shoal Creek Design Effluent Limitations**

| Effluent Parameter            | Units   | Limitations |             |              |
|-------------------------------|---------|-------------|-------------|--------------|
|                               |         | Daily Max   | Weekly Avg. | Monthly Avg. |
| Ammonia as N (Apr 1 - Sep 30) | mg/L    | 6.1         | -           | 1.2          |
| Ammonia as N (Oct 1 - Mar 31) | mg/L    | 11.9        | -           | 2.2          |
| E. coli (Apr 1 - Oct 31)      | #/100mL | -           | 630         | 126          |
| Oil & Grease                  | mg/L    | 15          | -           | 10           |
| Phenol                        | ug/l    | 4200.5      | -           | -            |
| Cadmium, Total Recoverable    | ug/l    | 0.6         | -           | 0.3          |
| Iron, Total Recoverable       | ug/l    | 1849.6      | -           | 702.5        |
| Selenium                      | ug/l    | 9.2         | -           | 3.2          |
| BOD <sub>5</sub>              | mg/L    | -           | 45          | 30           |
| Total Suspended Solids        | mg/L    | -           | 45          | 30           |

## **7.0 EVALUATION OF EXISTING TREATMENT FACILITIES**

### **7.1 Process Description and Evaluation**

The features and general conditions of each component of the facility are described below. Further, each component is evaluated based on its ability to accommodate both current and future design conditions.

#### **7.1.1 Crowder Lift Station**

At the end of the Crowder Plant is a lift station that conveys treated flow to the Shoal Creek Plant for UV disinfection and then discharge to Shoal Creek. This lift station is equipped with two 50 HP line shaft vertical turbine pumps capable of producing approximately 1,500 gpm at 97 feet TDH. This gives the pumping facility a firm capacity of 1,500 gpm (2.16 MGD) assuming one pump is out of service. Wastewater conveyed by these pumps travels through approximately 5.7 miles of 16" diameter pressure sewer to make it to the Shoal Creek Plant. Since this facility pumps flow to the Shoal Creek Plant, it must also be evaluated for any improvement needs and its ability to meet current and future flow conditions.

Comparing the pumping capacity of this facility to the current flow values for Crowder, it has adequate capacity for the average (0.9 MGD) and max month (1.7 MGD) conditions, but not the peak flow (5.0 MGD). This is validated by the fact that plant personnel have indicated that flow equalization basins at the plant fill up during peak flows. Similarly, for future conditions, the existing pumps could accommodate the average (1.1 MGD) and max month (2.1 MGD) flows, but not the peak flows (6.1 MGD). While flow equalization is available to help attenuate the peak flows, additional pumping capacity is likely needed to make sure that future flows do not exceed the capacity of the equalization basins.

In addition to the need for more pumping capacity, the existing pumps are simply in need of replacement due to age. At the time that additional capacity is pursued, it is recommended that the entire lift station be renovated to ensure adequate operation going into the future.

### **7.1.2      *Flow Equalization Basins***

The Shoal Creek Treatment Plant utilizes a flow equalization basin located roughly 1,600 feet upstream of where the main interceptor line ties into the plant. The basin has concrete walls with a clay/bentonite lined bottom and has a nominal capacity of approximately 12.1 million gallons. The basin is also equipped with a mechanically cleaned bar screen ahead of three submersible pumps. Each pump is 40 HP and designed to operate at 4,020 gpm (5.79 MGD) at 42 TDH. Both the screen and the pumps are located in the main channel that sees wastewater flow before being diverted to the basin.

Upon observation of the mechanical screen, it appears that some flow may be able to bypass the screen by flowing around the screen. This is thought to have no adverse impacts on the operation of the system and is not something that needs to be addressed. The screen appears to have adequate hydraulic capacity for both current and future flows, including if flow from Crowder is diverted through the screen. A submersible mixer is also located in the channel. The equipment and controls at the basin are equipped with a backup 130 kW generator.

A level transducer and backup float switch control the pumps to turn on based on the water level. As the water level in the channel reaches the defined set points, the pumps turn on to transfer flow over the channel wall and into the flow equalization basin. As peak flows subside, stored wastewater is allowed to gravity flow back into the sewer line via a manually operated sluice gate and continue to the Shoal Creek Plant.

Plant personnel have indicated that the pumps turn on to divert flow to the equalization basin too soon when the plant is still has capacity. This causes the equalization basin to fill too quickly. As such, the plant operators choose to operate the pumps manually instead of relying on the controls that are currently in place. When considering that each pump has a capacity of 5.79 MGD and is equipped with soft starts, it seems very likely that the pumping capacity of each pump is simply too great. Diverting that much flow at once relative to current flows, including peak flows, would leave very little flow to go to the plant. To provide better operation, it is recommended that the controls and operating characteristics of the pumps be altered to allow for better control of the facilities.

The Crowder Treatment Plant also has two flow equalization basins. The first basin is located near the head of the plant and has an estimated volume of 5,900,000 gallons. The other basin is much smaller and is located next to the lift station at the end of the plant that pumps flow to the Shoal Creek Plant. It has an estimated capacity of 100,000 gallons. Together, this provides

approximately 6,000,000 gallons of flow storage capacity at the Crowder Plant. No immediate improvements are needed to these facilities.

### **7.1.3      *Diversion Splitter Manhole***

Wastewater enters the Shoal Creek Treatment Plant via a 30" interceptor sewer which discharges into the diversion splitter manhole at the head of the plant. This structure allows the flow to be diverted using valves into either of the two pumps at the raw sewage pumping structure via two 24" pipes.

The existing facilities are in good working condition and are not anticipated to need to be replaced or improved in the near future. No other issues or needed improvements are identified for this structure. The diversion splitter manhole is thought to be adequate in its current condition to meet current and future needs.

### **7.1.4      *Raw Sewage Pumping Structure***

The raw sewage pumping structure consists of two, 8' diameter manholes each of which is equipped with a Fairbanks Morse vertical turbine pump. Each pump is rated for 3.0 MGD at 33' TDH. Each pump discharges through a 16" pipe before combining into a common 20" pipe that carries flow to the inlet structure. One pump is equipped with a VFD and both pumps operate off air bubbler systems. Plant personnel indicate that replacement parts for the pumps are hard to get. Considering the age of the existing pumps, it is likely that this will continue to be an issue until the pumps are replaced.

Considering there are only two pumps, the firm pumping capacity of this structure would be 3.0 MGD with one pump out of service. With that, the available pumping capacity is considered to be inadequate when compared to max month and peak flows for both current and future conditions at the Shoal Creek Plant. The ability to divert peak flows to the flow equalization basin does alleviate the need for this pumping structure to be able to handle all the flow during peak conditions. However, considering the condition of the existing pumps and the current capacity relative to design flow conditions, improvements to the facility will need to be made to allow for continued reliable operation. Greater pumping capacity will certainly be needed if Shoal Creek begins to treat flow from Crowder and flow from Crowder is rerouted to enter the Shoal Creek Plant ahead of the raw sewage pumps.

### **7.1.5      *Inlet Structure***

Wastewater pumped from the raw sewage pumping structure enters the west channel in the inlet structure, which contains multiple non-mechanical bar screens. As such, screens are manually cleaned, and waste is disposed of in a nearby dumpster. Valving located near the structure allows for flow from the 16" pressure sewer from Crowder to either be taken directly to the UV structure at the end of the Shoal Creek Plant or to be diverted into the eastern channel of the inlet structure after the bar screens. The former is how the facilities are normally operated. Further, both the east and west clarifiers send return-activated sludge to the east channel of the inlet structure. RAS going into the inlet structure is measured using a 9" Parshall Flume. Flow to either of the oxidation ditches can be shut off by slide gates located on the discharge end of the inlet structure channels. From the inlet structure, wastewater gravity flows to the oxidation ditches through 24" pipes.

Plant personnel have indicated that the slide gates at the end of the channels are hard to operate and could benefit from replacement. It was also noted that flow does not equalize well between the two channels in the inlet structure. This may be because the location of inflow from Crowder and/or the separation of influent and RAS channels causes unequal distribution of flow. While this is not necessarily an issue for current conditions, the need for additional facilities for treating flow from Crowder will require improvements for better control of the flow split between treatment trains.

Considering that all flow passes through the mechanical bar screen at the flow equalization basin, except for flow from Crowder, there appears to be a significant amount of debris that is getting caught on the bar screens in the inlet structure. According to plant personnel, this may be because septic haulers dump just upstream of the raw sewage pumps. As such, debris from these haulers is likely not only causing excessive buildup on the screens but is also being transferred through the raw sewage pumps. This creates the potential to damage and reduce the life of the pumps. For this reason, the current situation concerning the location or the outright ability of septic haulers to dump at the plant should be evaluated for possible revision to lessen potential adverse impacts on plant operations.

The bar screens themselves are also in fairly poor condition and should likely be replaced if screening at the inlet structure continues to be needed. Finally, personnel have indicated that there is significant sediment and grit buildup in the channels. As such, the implementation of improvements to remove grit from the waste stream and prevent it from migrating further into the plant is recommended.

### **7.1.6      *Oxidation Ditches***

Secondary treatment of the wastewater is provided by two oxidation ditches, each equipped with four 50 HP Hydro Rotors to provide aeration and mixing of the influent wastewater and RAS. The rotors are mounted on revolving horizontal shafts which are partially submerged in the wastewater. Three of the rotors in each ditch provide firm capacity while the fourth is a standby for emergency cases and maintenance. According to plant personnel, running two rotors does not provide sufficient oxidation, and running a fourth rotor leads to a higher solids concentration in the flow exiting the ditch. The higher concentrations with four rotors running are likely because the fourth rotor stirs up solids that have settled in the bottom of the ditches.

The rotors can vary in speed from 54-66 rpm as necessary and have a minimum and maximum submergence of 8" and 13", respectively. Each ditch is approximately 290' long by 44' wide, with oval ends. The channels are 16' in total depth with a 14' water depth which provides a volume of 1.5 MG per ditch and a total volume of 3.0 MG. Based on the current flows of the plant, the operators are able to facilitate treatment with only one of the oxidation ditches in use. Effluent from the ditches is discharged through rotating weirs to the clarifier splitter box. The weirs of both ditches have been replaced previously and work well.

MDNR design guidelines provide recommended loading ranges for activated sludge processes (*Wastewater Guidelines and Standards Document*, Table 9-6). For an oxidation ditch, it is recommended that the volumetric BOD<sub>5</sub> loading be in the range of 5-30 lb BOD<sub>5</sub>/day/1000 cf and the hydraulic retention time (V/Q) in the range of 8-36 hours. With a combined total of 3.0 MG between the two ditches, the operating range of the oxidation ditches is 2,005 lb BOD<sub>5</sub>/day to 12,030 lb BOD<sub>5</sub>/day and 2.0 MGD to 9.0 MGD, based on the described MDNR guidelines. At the design flow of 3.0 MGD, the hydraulic retention time is 24 hours.

Evaluating daily flows for the Shoal Creek Plant from January 2020 through December 2022, no instances were recorded that were greater than 9.0 MGD, meaning that the hydraulic retention time was never less than the minimum eight hours. Further, over this period, there was only one instance where BOD loading exceeded the maximum load established per MDNR guidelines of 12,030 lb BOD<sub>5</sub>/day. A value of 12,084 lb BOD<sub>5</sub>/day was recorded on January 3, 2020, barely exceeding the upper threshold value established by the guidelines. The next highest day for BOD loading had a value of 8,411 lb BOD<sub>5</sub>/day, below 12,030 lb BOD<sub>5</sub>/day. Further, the current maximum monthly loading was 5,937 lb BOD<sub>5</sub>/day which is also well below the capacity of the ditches. As such, the oxidation ditches have adequate capacity for current conditions treating flows going to the Shoal Creek Plant.

For future conditions reflecting only treating Shoal Creek flows, the existing ditches are still adequate. While the estimated peak value of 14,622 lb BOD<sub>5</sub>/day from Table 6-1 exceeds the plant capacity, it still reflects only a singular peak loading day. The maximum monthly loading is 7,183 lb BOD<sub>5</sub>/day which is a more reasonable design criteria and does not exceed the plant capacity. The 9.0 MGD hydraulic capacity of the ditches is also greater than the future flows presented in Table 6-1.

Using the same values established previously by MDNR guidelines for BOD<sub>5</sub> loading rate and hydraulic retention time, current and future conditions at the Shoal Creek Plant when it treats all of Crowder's flow must also be considered relative to the criteria established in Table 6-1. Based on these values, the existing ditches would likely struggle under current and future peak BOD<sub>5</sub> loading conditions if also treating flow from Crowder. Hydraulically, the current capacity of the ditches meets maximum month flows but cannot handle peak flows for both current and future conditions. Considering the use of flow equalization, the hydraulic capacity of the ditches is adequate. However, additional capacity would be needed to be able to consistently and effectively treat the additional BOD loads from the Crowder Plant.

The oxidation ditches must also be evaluated based on the ability of the rotors to supply oxygen relative to the oxygen required for the proper treatment of the wastewater. Considering six rotors each having an effective length of 18', an average submergence depth of 13", and a speed of 66 rpm, each rotor can supply 126 lbs of O<sub>2</sub> per hour (per the O&M manual for the rotors) to provide a total firm capacity of 756 lbs of O<sub>2</sub> per hour.

To calculate the actual oxygen required (AOR) for BOD<sub>5</sub> removal, it is assumed that 1.4 lbs of O<sub>2</sub> per lb of influent BOD<sub>5</sub> is required considering the maximum monthly BOD<sub>5</sub> load. Similarly, it is assumed that 4.6 lbs of O<sub>2</sub> per lb of influent NH<sub>3</sub> is also required for ammonia removal. Since influent NH<sub>3</sub> concentration data is not available, NH<sub>3</sub> loadings will be based on an assumed concentration of 30 mg/L and the respective maximum monthly design flow. Together, the oxygen required for the removal of BOD<sub>5</sub> and NH<sub>3</sub> gives the AOR. Further, the equation below is used to calculate the standard oxygen required (SOR) for the various design conditions.

$$SOR = \frac{(AOR)(C_s)}{(\alpha)(\theta^{(T-20)})[(\beta)(C_{sc} - C_L)]}$$

Where: SOR is Standard Oxygen Requirement  
AOR is Actual Oxygen Requirement  
 $\alpha$  (0.85) is the Oxygen Transfer Correction Factor  
 $\beta$  (0.95) is the Salinity – Surface Tension Correction Factor  
 $\theta$  (1.024) is the Oxygen Transfer Coefficient  
T (12) is Degrees Celsius Temperature of Water  
 $C_{sc}$  (10.5) is the Dissolved Oxygen Concentration at 40% depth at the site elevation and temperature in mg/L  
 $C_s$  (9.02) is the Dissolved Oxygen Saturation Concentration in clean water at 20 Degrees C in mg/L  
 $C_L$  (2.00) is the Operating Dissolved Oxygen Concentration in mg/L

Table 7-1 provides the AOR and SOR for current and future design conditions.

**Table 7-1. Standard Oxygen Required at Design Conditions**

|                       | Shoal Creek    |                | Shoal Creek and Crowder |                |
|-----------------------|----------------|----------------|-------------------------|----------------|
|                       | AOR<br>(lb/hr) | SOR<br>(lb/hr) | AOR<br>(lb/hr)          | SOR<br>(lb/hr) |
| <b>Current (2023)</b> | 557            | 885            | 685                     | 1088           |
| <b>Future (2043)</b>  | 674            | 1071           | 829                     | 1317           |

Comparing the firm capacity of the existing rotors to the calculated SOR values, the ability of the current facilities to supply oxygen for proper treatment is inadequate for all design conditions. As such, additional oxygen supply capabilities are recommended.

Plant personnel have indicated that the bearings for the rotor shafts have experienced failures over the years. Due to this, the rotor shafts have bent, and this has caused the motor to move while in operation. The facility has increased the size of the shafts when they have needed to be replaced, but this seems to have only exacerbated the issues and caused more rotor shaft failures. Considering this, the rotors appear to need major repairs, if not replacement.

It was also noted that 6" drain lines from the ditches to the diversion splitter manhole take quite some time to drain the ditches. Upsizing these lines is something that should be considered.

### **7.1.7 Clarifier Flow Splitter Box**

The clarifier flow splitter box receives effluent from both oxidation ditches and directs flow to either or both secondary clarifiers via 24" pipes. Each channel of the splitter box is fitted with a slide gate to be able to isolate the clarifiers and weirs to control the flow split between the clarifiers. Flow exits the splitter box through 24" pipes to go to the clarifiers. No issues are reported with the existing clarifier flow splitter box.

### **7.1.8 Secondary Clarifiers**

After exiting the clarifier splitter box, wastewater enters the secondary clarifiers, each of which is 65' in diameter and has a side water depth of 12' and a total depth of 13.75' around the perimeter. The clarifiers are full-bridge peripheral feed, center flow clarifiers. Wastewater enters the clarifiers through the side skirts which help reduce the velocity of the incoming flow. Biomass settles at the bottom of the clarifier and the treated effluent discharges at the center of the clarifier through a 24" pipe to go to the UV disinfection system.

Based on MDNR design guidelines (*Wastewater Guidelines and Standards Document*, Table 7-3), the surface overflow rate (SOR) of the clarifiers at design peak hourly flow should be less than 1,000 gpd/ft<sup>2</sup>. Each clarifier has a surface area of 3,318.3 for a total area of 6,636.6 ft<sup>2</sup>. Based on a maximum SOR of 1,000 gpd/ft<sup>2</sup>, each clarifier can handle up to 3.32 MGD and both clarifiers together have a capacity of approximately 6.64 MGD.

Comparing the hydraulic capacity of the clarifiers to the design flows established in Table 6-1, the existing facilities do not have adequate capacity for the future Shoal Creek peak flow as well as current and future peak flows if also treating flow from Crowder. While the existing facilities may be able to accommodate future peak flows for just the Shoal Creek Plant when accounting for flow equalization, an increase in hydraulic capacity would be needed if Shoal Creek were to start treating flow from the Crowder Plant.

The solids loading rate through the clarifiers must also be considered for both current and future conditions. MDNR guidelines indicate that the peak solids loading rate should not exceed 40 lb/day/ft<sup>2</sup>. Peak solids loading rates can be calculated using the formula below.

$$Peak\ SLR\ \left(\frac{lb/sf}{day}\right) = \frac{\left((PF\ (MGD) + 1.5 \times ADF\ (MGD)) \times MLSS\ Conc.\ \left(\frac{mg}{L}\right) \times 8.345\right)}{Clarifier\ Surface\ Area\ (sf)}$$

Based on an average MLSS concentration of 3,000 mg/l and the respective design flows, Table 7-2 provides calculated peak solids loading rates for the various design conditions.

**Table 7-2. Peak Solids Loading Rates**

|                                     | Shoal Creek | Shoal Creek and Crowder |
|-------------------------------------|-------------|-------------------------|
| <b>Current Peak SLR (lb/day/sf)</b> | 34          | 58                      |
| <b>Future Peak SLR (lb/day/sf)</b>  | 42          | 70                      |

Based on the values from Table 7-2, the existing clarifiers have adequate solids loading capacity at current and future conditions for Shoal Creek. Even though the future SLR of 42 lb/day/ft<sup>2</sup> exceeds the MDNR value, it does so just barely. As such, the existing facilities are thought to be accurate but will be at capacity for future Shoal Creek conditions. However, additional clarifier capacity will be needed for the Shoal Creek Plant to treat both the current and future flows from Crowder.

The weir loading rate must be evaluated as well. With a side length of 25' for the square weir in each clarifier, each clarifier has a weir length of 100 ft for a total of 200 ft of weir between the two clarifiers. Per MDNR guidelines, the maximum weir loading rate of 30,000 gpd/ft is allowed. Considering the peak flows for the various design conditions, Table 7-3 provides the respective weir loading rates.

**Table 7-3. Weir Loading Rates**

|                                 | Shoal Creek | Shoal Creek and Crowder |
|---------------------------------|-------------|-------------------------|
| <b>Current Weir LR (gpd/ft)</b> | 27500       | 52500                   |
| <b>Future Weir LR (gpd/ft)</b>  | 33275       | 63525                   |

Based on the values presented in Table 7-3, the existing clarifier weirs only have adequate length for current peak flows treating only flow for Shoal Creek. To accommodate future peak flows and both current and future flows from Crowder, additional weir length is needed.

The skirts on both of the clarifiers were replaced in 2009 as the then-existing skirts were deteriorating. The same is now also true for the current skirts. In addition to that, the current peripheral feed, center flow type clarifiers are an older type of design. Installation of new equipment that provides easier operation and maintenance, replacing the existing would be a more beneficial improvement than just replacing the existing skirts again. The replacement of the skirts is needed at a minimum if the existing clarifier equipment is not replaced entirely as part of larger improvements to the existing clarifier facilities.

### **7.1.9      *Return Activated and Waste Activated Sludge Pump Station***

The RAS/WAS Pump Station consists of two pumps for pulling return and waste-activated sludge from the clarifiers. Each pump sits in a 30" ductile iron pipe that acts as a wet well and connects to a 10" sludge line from each clarifier. A 10" line with a plug valve interconnects the two 30" DIP wet wells. When the valve is shut, each pump can only pull from its respective clarifier. Opening the valve allows for a pump to pull from either clarifier. Return sludge is pumped back to the inlet structure through a 12" line. RAS flow is measured by a 9" Parshall flume. Wasted sludge is pumped via a 6" line to the sludge storage facilities. The sludge pumps are rated at 500 gpm.

Plant personnel have indicated that they have limited control over pulling sludge from one clarifier or the other. As such, personnel have difficulty removing equal amounts of sludge from each clarifier. Considering the configuration of the facility, it is likely that this is related to the plug valve intended to allow for the separation of the two wet wells. It was also noted that the existing valves are difficult to operate and need replacement. It is recommended that the existing valves be replaced as well as additional valves installed as needed to provide improved operation of the facilities.

Plant personnel have also indicated that the existing sludge pumps have long since passed the end of their useful life. The pumps require regular maintenance and due to their age, replacement parts are no longer manufactured. Therefore, parts are difficult to get at best or must be manufactured. Either way, this creates long lead times for pump repairs leading to prolonged periods of pumps being out of service. Considering the issues with the pumps, it is recommended that the sludge pumps be replaced at a minimum and improvements be made to the station to allow the facility to continue to operate effectively in the future.

### **7.1.10      *Sludge Storage and Disposal***

Sludge that is not returned to the inlet structure is wasted to the sludge storage facilities. Sludge storage consists of one 80' diameter by 14' deep tank and two 55' diameter by 11' deep storage tanks. All sludge initially wasted from the clarifiers is pumped to the 80' storage tank via a 6" line. To make it to the 55' diameter tanks, the sludge is pumped from the 80' tank via sludge pumps in a wet well located west of the 80' diameter tank.

All three sludge storage tanks have floating aerators to provide aerobic digestion of the sludge. The supernatant that is decanted from the 80' diameter tank flows back to the nearby influent diversion splitter manhole. Decant from the two 55' diameter tanks is pumped back into the plant

via a nearby pump station. For disposal, sludge is pumped from the tanks and hauled to fields for land application.

Assuming two feet of freeboard, the 80' diameter tank has approximately 451,240 gallons of storage capacity. Similarly, for the 55' diameter tanks, each would have approximately 160,000 gallons of storage capacity for a total of 320,000 gallons. All three tanks together provide approximately 771,240 gallons of sludge storage. Based on sludge data from 2020 to 2022, the Shoal Creek Plant averages approximately 134 dry tons of sludge per year. The Crowder Plant averages approximately 110 dry tons of sludge per year. Assuming an average solids concentration of 2.5%, this equates to approximately 1,285,370 gallons of sludge annually for the Shoal Creek Plant and 1,055,150 gallons of sludge annually for the Crowder Plant. Applying the same 21% increase in flow for future conditions to the sludge production gives a future Shoal Creek value of 1,555,300 gallons per year and Crowder a value of 1,276,730 gallons per year.

Considering the available sludge storage volume at the Shoal Creek Plant, the existing facilities provide approximately 219 days of storage for current Shoal Creek flows and 181 days for future Shoal Creek conditions. Accounting for Crowder's flows as well, the current storage capacity of the Shoal Creek tanks would provide approximately 120 days of sludge storage at current flows and 99 days at future conditions. Per MDNR design guidelines, a minimum range of 120 to 180 days of sludge storage should be provided for the design life of the facility. As such, the existing facilities at the Shoal Creek Plant are adequate for current and future conditions when only treating Shoal Creek flows, but storage providing a minimal additional 21 days would be needed to accommodate future flows from Crowder.

The tanks themselves are in good condition. The aerators in the tanks work well but are nearing the end of their useful life and could benefit from replacement. Similarly, the decant valves work well but could be replaced in order to maintain proper functionality going into the future.

#### **7.1.11 UV Disinfection**

Disinfection is accomplished using ultraviolet disinfection equipment. The effluent flows to a Parshall flume structure for metering. The structure has two 12" wide flumes, one of which measures flow from the clarifiers of the Shoal Creek WWTP and one that measures flow from the Crowder WWTP. Ultrasonic level transducers measure the depth in each channel. Combined flows from both WWTPs are disinfected in a single channel. There are two banks of UV bulbs, each rated to disinfect up to 3 MGD which provides a total capacity of 6.0 MGD. Each bank of UV lights is either fully on or fully off and does not vary with the incoming flow. At the end of the UV

disinfection system, there is a modulated weir gate to vary discharge based on the flow through the equipment.

The 6.0 MGD capacity of the existing UV facilities is less than that of the future Shoal Creek peak flows and the combined peak flows for Shoal Creek and Crowder, both current and future. While peak flow equalization will allow the existing facilities to be adequate for future Shoal Creek flows, it is likely that additional capacity will be needed to handle the additional flow from Crowder.

The existing UV equipment is in good working condition, though it is starting to show its age having been almost 20 years since it was installed. Plant personnel have indicated that equipment set at an angle would improve the ease of maintenance compared to the existing equipment which is set horizontally. However, the dimensions of the existing channel will not allow for the installation of non-horizontal equipment. As such, new channels would have to be constructed if different equipment were to be installed.

Replacing the existing equipment is not an immediate need but is something that should be planned for in the future. If, however, Shoal Creek treating Crowder's flow is pursued, replacement of the UV facilities should be implemented alongside other improvements to the plant.

#### **7.1.12     *Electrical and Back-Up Power Facilities***

Back-up power to the Shoal Creek Plant is currently provided by a 400 kW diesel generator. Plant personnel have indicated that the UV equipment is not tied into the generator and is likely because the existing generator does not have enough capacity to accommodate those facilities. Considering that it is only the UV structure that may not be on backup power, additional generator capacity is not thought to be necessary. However, with the construction of improvements to accommodate flow from Crowder, additional backup power capacity will be needed.

Personnel have also noted that the generator at the Shoal Creek Plant does not have an automatic transfer switch. As such, in the event of a power failure, personnel must travel out to the generator to switch over to backup power. Manual operation of the transfer switch is also a safety concern for personnel regarding the potential for arc flash. Therefore, the installation of an automatic transfer switch is highly recommended to eliminate the need for manual operation.

### 7.1.13 Process Evaluation Summary

Table 7-4 provides a summary of the evaluation of each process described previously in this section.

**Table 7-4. Shoal Creek Process Evaluation Summary**

| Component                                    | Improvement Needed                                                      | Reason For Improvement                                                                                                                                                       | Improvement Priority                              |
|----------------------------------------------|-------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------|
| <b>Crowder Lift Station</b>                  | Additional pumping capacity and renovation of the lift station          | The current pumping capacity is not adequate for future flow conditions. The existing facilities are nearing the end of their useful life and need upgrades.                 | Medium Priority                                   |
| <b>Flow Equalization Basin - Shoal Creek</b> | Additional equipment for better operational control                     | The current setup turns pumps on too early filling up the basin when the plant still has treatment capacity. As such, personnel turn on pumps manually.                      | Low Priority                                      |
|                                              | Relocate Crowder discharge point                                        | If Shoal Creek treats wastewater from Crowder, the current location of discharge would not allow Crowder's flow to be screened.                                              | High Priority (if planning to treat Crowder flow) |
| <b>Flow Equalization Basin - Crowder</b>     | None                                                                    | -                                                                                                                                                                            | -                                                 |
| <b>Diversion Splitter Manhole</b>            | None                                                                    | -                                                                                                                                                                            | -                                                 |
| <b>Raw Sewage Pumping Structure</b>          | Pump replacement with increased capacity and renovation of the facility | Existing pumps are old, requiring frequent and time-consuming maintenance. Parts are difficult to find. Pumps have inadequate firm capacity for most design flow conditions. | High Priority                                     |

| Component                | Improvement Needed                                         | Reason For Improvement                                                                                                                                                                                                                                                                                                                                   | Improvement Priority                                   |
|--------------------------|------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------|
| <b>Inlet Structure</b>   | Replace slide gates and bar screens.                       | Existing gates are hard to operate. Existing screens are in poor condition.                                                                                                                                                                                                                                                                              | Medium Priority                                        |
|                          | Revise allowances for septic haulers dumping at the plant. | The location of dumping creates the potential for solids to be transferred through pumps and into the plant.                                                                                                                                                                                                                                             | Medium Priority                                        |
|                          | Construction of flow splitter box structure.               | The construction of additional treatment facilities to accommodate flow from Crowder requires a structure to be constructed to better control flow distribution between trains.                                                                                                                                                                          | High Priority (if planning to treat flow from Crowder) |
|                          | Construction of grit removal facility                      | A new facility would greatly reduce the amount of solids that make their way into the plant which increases treatment effectiveness and reduces maintenance.                                                                                                                                                                                             | Low Priority                                           |
| <b>Oxidation Ditches</b> | Replace existing Hydro Rotors with new equipment           | The shafts on the existing rotors are frequently failing, even after attempted repairs. Maintenance of the existing facilities has become a constant struggle to keep the rotors in operation. Further, the existing rotors are unable to provide adequate oxygen for the proper treatment of wastewater, especially when considering future conditions. | High Priority                                          |
|                          | Construct additional oxidation ditch capacity              | The existing facilities do not have adequate volumetric BOD loading capacity and hydraulic retention time to accommodate untreated flow from Crowder.                                                                                                                                                                                                    | High Priority (if planning to treat Crowder flow)      |
|                          | Increase the size of the drain line from oxidation ditches | The current 6" drain line takes a long time to drain the ditches, increasing the downtime during maintenance.                                                                                                                                                                                                                                            | Low Priority                                           |

| Component                                             | Improvement Needed                                   | Reason For Improvement                                                                                                                                                                                                                                                                                        | Improvement Priority                              |
|-------------------------------------------------------|------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------|
| <b>Clarifier Flow Splitter Box</b>                    | None                                                 | -                                                                                                                                                                                                                                                                                                             | -                                                 |
| <b>Secondary Clarifiers</b>                           | Install new clarifier equipment                      | The existing skirts are deteriorating again. Further, replacing the existing equipment with that of a different design would be beneficial to overall operation and maintenance. New equipment would also provide additional weir length to allow the two basins to be adequate for future Shoal Creek flows. | High Priority                                     |
|                                                       | Construct additional clarifier capacity              | The existing clarifiers do not have adequate capacity to meet Surface Overflow Rate and Peak Solids Loading Rate criteria when treating flow from Crowder.                                                                                                                                                    | High Priority (if planning to treat Crowder flow) |
| <b>Return and Waste Activated Sludge Pump Station</b> | Replace existing pumps and renovate the pump station | Existing valves are difficult to operate. The system cannot currently isolate which clarifier sludge is wasted from. Existing pumps require constant maintenance and repairs with parts having to be fabricated. As such, pumps are constantly out of service.                                                | High Priority                                     |
| <b>Sludge Storage</b>                                 | Construct additional sludge storage capacity         | The existing sludge storage capacity is not adequate to accommodate sludge generated by treating flow from Crowder.                                                                                                                                                                                           | High Priority (if planning to treat Crowder flow) |
|                                                       | Replace decant valving                               | The existing decanting valves are deteriorating, and replacement should be considered.                                                                                                                                                                                                                        | Low Priority                                      |
|                                                       | Replace floating aerators                            | The existing aerators function properly, but due to their age should be expected to need replacement in the near future.                                                                                                                                                                                      | Low Priority                                      |
| <b>UV Disinfection</b>                                | Replace existing UV equipment                        | The existing equipment is nearing the age where replacement should be considered.                                                                                                                                                                                                                             | Low Priority                                      |
|                                                       | Construct additional UV disinfection capacity        | The existing facilities do not have adequate capacity for treating future flows from Crowder.                                                                                                                                                                                                                 | High Priority (if planning to treat Crowder flow) |

| Component                    | Improvement Needed                                          | Reason For Improvement                                                                                                                         | Improvement Priority                              |
|------------------------------|-------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------|
| <b>Electrical Facilities</b> | Provide additional backup power                             | Backup power is currently adequate. However, more will be required to accommodate the additional facilities needed to treat flow from Crowder. | High Priority (if planning to treat Crowder flow) |
|                              | Install automatic transfer switch to the existing generator | Without an ATS, the use of backup power requires manual operation.                                                                             | High Priority                                     |

## 7.2 Facility Operation and Performance

In general, most facilities at the Shoal Creek Plant are original from when the plant was built in the mid-1980s. As such, a majority of the facilities have passed the end of their useful life, causing them to require frequent maintenance and repairs. Considering the age of the facilities, it is common for replacement parts to be difficult to find, if they can be found at all. This therefore requires parts to often be fabricated and custom-made. All of this leads to increased operation and maintenance costs in the form of additional materials and labor required to keep the plant operating properly.

Table 7-5 provides a summary of DMR effluent data from January 2020 to December 2022 for pollutants with established effluent limitations for Outfall #001 and #IP5 (discharge from the Shoal Creek Plant).

**Table 7-5. Discharge Monitoring Report (DMR) Summary**

|                            | Outfall #001              |                      |              |              |              |                  |               | #IP5                       |               |
|----------------------------|---------------------------|----------------------|--------------|--------------|--------------|------------------|---------------|----------------------------|---------------|
|                            | NH <sub>3</sub><br>(mg/l) | E. coli<br>(#/100ml) | Se<br>(ug/l) | Fe<br>(ug/l) | Cd<br>(ug/l) | Phenol<br>(ug/l) | O&G<br>(mg/l) | BOD <sub>5</sub><br>(mg/l) | TSS<br>(mg/l) |
| <b>Daily Max (High)</b>    | 7.3                       | -                    | 1            | 61.8         | 0.41         | 300              | 14.8          | -                          | -             |
| <b>Daily Max (Avg.)</b>    | 0.35                      | -                    | 0.89         | 51.6         | 0.28         | 62.5             | 5.8           | -                          | -             |
| <b>Weekly Avg. (High)</b>  | -                         | 414                  | -            | -            | -            | -                | -             | 18.9                       | 20.6          |
| <b>Weekly Avg. (Avg.)</b>  | -                         | 63.1                 | -            | -            | -            | -                | -             | 3.3                        | 4.8           |
| <b>Monthly Avg. (High)</b> | 3.7                       | 35.2                 | 1            | 61.8         | 0.41         | 62.5             | 14.8          | 6.1                        | 4.9           |
| <b>Monthly Avg. (Avg.)</b> | 0.26                      | 12.9                 | 0.89         | 51.6         | 0.28         | 30.0             | 5.8           | 2                          | 3.7           |

A review of Discharge Monitoring Reports (DMRs) shows the following exceedances from the period of 2020-2022:

- Cadmium Monthly Average: December 2021 (value of 0.41 mg/l exceeded limit of 0.3 mg/l)
- BOD<sub>5</sub> Percent Removal: April 2021 (value of 75%, not meeting limit of 85%), April 2022 (value of 77%, not meeting limit of 85%)
- Ammonia Monthly Average: December 2021 (value of 3.7 mg/l exceeded limit of 2.2 mg/l)
- TSS Percent Removal: April 2022 (value of 70%, not meeting limit of 85%), December 2022 (value of 77%, not meeting limit of 85%)

Considering these violations over the past three years, the Shoal Creek Plant has essentially had minimal issues meeting the established permit limits. The cadmium and ammonia violations appear to be isolated incidents, as do the BOD and TSS removal violations. However, the BOD and TSS removal violations appear to be indicative of low influent concentrations, making the percent removal not a concern as the facility still met effluent concentration limits. A copy of the most recent MDNR inspection report of the Shoal Creek Plant is in Appendix D.

## **8.0 WASTEWATER TREATMENT ALTERNATIVES**

In order to accommodate the year 2043 conditions described previously, various alternatives are outlined in this section. These alternatives include regionalization, land application, and renovation and expansion improvements to the existing wastewater treatment facility. For the consideration of improvements to the existing facilities, the future conditions presented in Table 6-1 will be used as the basis for design.

### **8.1 No-Action Alternative**

MDNR requires a do-nothing alternative to be considered [10 CSR 20-8.110(5)(D)]. This alternative presents the option for Neosho to not pursue any improvements to the existing Shoal Creek Plant. Considering the condition of the existing facilities as well as their capacity to accommodate future Shoal Creek flows and loads in some respects, a no-action alternative is not viable. Further, a no-action alternative is certainly not an option should the City wish to rely on the Shoal Creek facilities to treat flow from Crowder as additional facilities would need to be constructed.

### **8.2 Flow and Waste Reduction**

Flow reduction measures are usually directed toward removing “excessive” infiltration/inflow from the collection system. As detailed in Section 5.1.4, flow reduction measures directed towards removing “excessive” infiltration/inflow from the collection system could have an impact on reducing flows to the WWTP. Although this report does recommend that the City explore I&I reduction measures, those measures alone cannot be counted on to sufficiently reduce the flows to a level where the current plant can effectively handle design flow conditions. Flow reduction is too long of a process and the results are too unpredictable to postpone improvements for more immediate needs. Further, a reduction in I&I does nothing to reduce the organic loading at the plant. To accommodate the organic loads from Crowder, additional facilities are needed. Finally, the condition of much of the existing equipment at the Shoal Creek Plant is such that it needs replacement. All that said, flow and waste reduction alone will not be a reasonable alternative.

### **8.3 Optimum Operation of Existing Facilities**

Optimizing the operation of the existing facility does not address the fact that most of the equipment has passed the end of its useful life and needs replacement. Further, the existing facilities cannot be optimized to be able to accommodate the additional flows and loads from the Crowder Plant, should the option be pursued.

### **8.4 Regionalization Alternative**

Regionalization involves sharing physical infrastructure in a defined geographic area when a political or private entity provides wastewater service by means of physically connecting existing and future communities to a regional or central plan. When multiple entities work together, each utility often benefits from reduced capital and operational costs, and increased economies of scale.

The City of Joplin is the nearest city with even the potential to be able to accommodate Neosho's wastewater flows. Therefore, it is theoretically possible to pump Neosho's wastewater from the location of the current WWTP to the Joplin Shoal Creek WWTP, and then contract with the City of Joplin to treat the wastewater. To do so would require the construction of at least one major lift station and approximately 112,000 lineal feet of pressure sewer. Assuming a flow rate of 7.3 MGD (5,070 gpm) must be conveyed to Joplin to accommodate Neosho's future peak flows with higher flows being attenuated by flow equalization, it is estimated that a minimum pressure sewer diameter of 24" would be required. Assuming 24" PVC pressure sewer costs approximately \$350/LF installed, the pipe alone would cost \$39,200,000. This illustrates that the cost of regionalization is simply not economically feasible, especially when compared to the costs of other alternatives discussed in the report.

## 8.5 Land Application

Surface land application is defined as the application of wastewater to the land surface at a controlled rate. Surface land application benefits the crop and soil and eliminates a discharge to the waters of the state. A land application system typically consists of three major components including a waste stabilization pond to provide primary treatment, a storage basin to retain wastewater flows when inclement weather conditions prevent irrigation operations, and an irrigation system. Both treatment and storage can be accomplished in a single-cell lagoon having varied operating depths. Irrigation system components typically include an irrigation pump and building along with a sprinkler system, such as a center pivot irrigator.

Given the size of Neosho, large tracts of land would be needed to accommodate the necessary storage and irrigation rates. Assuming a minimum volume to provide 75 days of storage in a new basin for the anticipated 4.0 MGD flows at future average day conditions, approximately 300 million gallons of usable storage would be required. The primary treatment lagoon must also be sized such that the surface area provides treatment for BOD<sub>5</sub> loadings less than 34 lb/day/acre. At the future estimated average day BOD<sub>5</sub> loading rate of 4,737 lb/day for Shoal Creek and Crowder, a minimum of 197.5 acres of lagoon surface area at the three-foot operating depth will be required. At this area, this roughly equates to an operating depth of 5 feet to achieve 300 million gallons of usable storage. Accounting for two feet of depth below the minimum operating level for seal protection and sludge storage as well as three feet of freeboard until the emergency spillway and another foot above that, a total estimated basin depth of 11 feet is expected.

In addition to the minimum size of the treatment and storage lagoon, maximum irrigation rates must also be considered. It is important that the daily application of water does not result in runoff from the field, therefore it is appropriate to limit the application rate to less than 0.5 inches per day (and less than 24 inches per year) by providing adequate irrigation area. Based on an average future daily flow of 4.0 MGD for both Shoal Creek and Crowder flows, this equates to approximately 1.46 billion gallons of wastewater annually. Based on that volume, it is reasonable to assume that at least 2,240 acres would be irrigated, resulting in a yearly application of up to 24 inches.

Considering only the estimated size of the storage/treatment lagoon and the irrigated area required, the facilities needed are simply too large for land application to be a practical alternative.

## **8.6 Improvements to Existing Facilities**

Another option is to retain as much of the existing facilities as possible while implementing improvements necessary to address deficiencies described previously in this report. This section describes the various improvements needed for the existing facilities to meet the projected future demands. For facilities where further modifications are required to accommodate treating flow from the Crowder Plant, additional discussion and construction costs are provided.

### **8.6.1 Crowder Lift Station**

#### **Lift Station Renovation – Medium Priority**

The Crowder Lift Station is a key facility and therefore, it is important that it remains in proper operating condition. While the existing pumping capacity appears to be adequate for future average and max month flows, the condition of the Crowder Lift Station is such that it is nearing time for improvements.

In general, the proposed improvements would involve constructing a new lift station to replace the existing one. The existing vertical turbine pumps would be replaced with new submersible pumps and controls. Submersible pumps work better in raw sewage conditions than the existing pumps, providing for operations that are more efficient and that require less maintenance. The new pumps would be equipped with VFDs to allow better control of operations. More specifically, this will allow for more efficient use of the existing flow equalization facilities, especially if Shoal Creek were to treat flow from Crowder. For instance, if the Shoal Creek plant is seeing too much flow, the pumps at the Crowder Lift Station could be slowed to fill up the equalization basins at Crowder more quickly and not fill up the basin at Shoal Creek as quickly. To provide additional pumping capacity, it is estimated that two 130-HP pumps, each capable of producing 2,300 gpm at 130 TDH would be installed. To accommodate the larger pumps, it is assumed that a new 10' wet well will be installed along with a new valve pit and valving.

Considering the condition of the 16" pressure sewer is unknown, the line should be inspected prior to implementing the improvements to the Crowder lift station. If there are concerns about the integrity of the existing pressure sewer and its ability to handle increased pressures from larger pumps, these should be addressed before new facilities go into operation. While the cost for inspecting the pressure sewer is included in the provided cost estimate, a cost for any repairs has not been included as the extent of repairs, if any, cannot be estimated.

Table 8-1 provides a cost estimate for constructing the described improvements to the Crowder Lift Station.

**Table 8-1. Cost Estimate for Crowder Lift Station Improvements**

| ITEM | QUANTITY | UNIT | DESCRIPTION                                | UNIT PRICE    | TOTAL                  |
|------|----------|------|--------------------------------------------|---------------|------------------------|
| 1    | 1        | LS   | Submersible Pumps                          | \$ 230,000.00 | \$ 230,000.00          |
| 2    | 1        | LS   | Pump Controls                              | \$ 130,000.00 | \$ 130,000.00          |
| 3    | 1        | LS   | Removal of Existing Improvements           | \$ 10,000.00  | \$ 10,000.00           |
| 4    | 1        | LS   | 10' Dia. WW, Valve Pit, Piping and Valving | \$ 300,000.00 | \$ 300,000.00          |
| 5    | 1        | LS   | Jib Crane                                  | \$ 25,000.00  | \$ 25,000.00           |
| 6    | 1        | LS   | Connection to Ex. 24" Dia. Gravity Line    | \$ 15,000.00  | \$ 15,000.00           |
| 7    | 1        | LS   | Connection to Ex. 16" Dia. Pressure Sewer  | \$ 12,000.00  | \$ 12,000.00           |
| 8    | 1        | LS   | Connection to Flow Equalization Basin      | \$ 15,000.00  | \$ 15,000.00           |
| 9    | 1        | LS   | Magnetic Flow Meter and Pit                | \$ 40,000.00  | \$ 40,000.00           |

### 8.6.2 Flow Equalization Basin

#### **Peak Flow Pump Control Improvements – Low Priority**

The pumps at the Shoal Creek flow equalization basin currently operate via a level transducer and float switch to control when the pumps are turned on and off. In the current configuration, the pumps turn on too soon, diverting flow to the basin when the Shoal Creek Plant could still accommodate more. As such, plant operating personnel operate the pumps manually. To provide better control and operations of these facilities, variable frequency drives should be installed on the existing peak flow pumps. This will allow the pump speed to be automatically altered based on the water level in the channel. At lower water levels, the pumps will divert a lesser amount, but the diversion rate will increase if the water level continues to rise. This will provide more control over how much flow gets diverted to the peak flow basin and how much flow is going to the Shoal Creek Plant.

Table 8-2 provides a cost estimate for the proposed improvements to the peak flow pumps at the Shoal Creek Flow Equalization Basin.

**Table 8-2. Cost Estimate for Improvements to the Peak Flow Pumps**

| ITEM | QUANTITY | UNIT | DESCRIPTION                       | UNIT PRICE   | TOTAL                |
|------|----------|------|-----------------------------------|--------------|----------------------|
| 1    | 3        | EA   | VFD's for Existing 40 HP Pumps    | \$ 40,000.00 | \$ 120,000.00        |

|      |          |      | <b>Construction Cost Estimate</b> |              | <b>\$ 150,000.00</b> |

### 8.6.3 Raw Sewage Pumping Structure

#### **Facility Renovation – High Priority**

The current firm capacity of the raw sewage pumping structure of 3.0 MGD is insufficient for current and future Shoal Creek max month and peak flow conditions. While peak flow equalization is available, additional pumping capacity is recommended for accommodating max month and peak flows for both current and future Shoal Creek flows. Also, considering the condition of the pumps, replacement and renovation of the existing facilities are recommended.

The proposed improvements would involve installing submersible pumps in the two existing 8' diameter wet wells. Considering future flows for Shoal Creek alone, three pumps capable of producing 3,000 gpm each would provide a firm capacity of 6,000 gpm (8.64 MGD) with one pump out of service. This would provide more than adequate pumping capacity for future peak flows. Two pumps would be installed in one existing wet well and one pump in the other with a spot for a fourth pump. Each pump would be equipped with a VFD to allow for more efficient operation. Table 8-3 provides a cost estimate for these improvements.

**Table 8-3. Cost Estimate for Raw Sewage Pump Station Improvements**

| ITEM                              | QUANTITY | UNIT | DESCRIPTION                      | UNIT PRICE    | TOTAL                |

#### 8.6.4 Inlet Structure

##### **Replace Slide Gates and Bar Screens – Medium Priority**

As described previously, the existing slide gates and bar screens in the Inlet Structure need replacement. Table 8-4 provides a cost estimate for the replacement of these items.

**Table 8-4. Cost Estimate for Inlet Structure Replacements**

| ITEM | QUANTITY | UNIT | DESCRIPTION                       | UNIT PRICE   | TOTAL               |
|------|----------|------|-----------------------------------|--------------|---------------------|
| 1    | 2        | EA   | Replace Slide Gates               | \$ 20,000.00 | \$ 40,000.00        |
| 2    | 1        | LS   | Replace Bar Screens               | \$ 15,000.00 | \$ 15,000.00        |
|      |          |      | <b>Construction Cost Estimate</b> |              | <b>\$ 55,000.00</b> |

##### **Septic Hauler Dumping – Medium Priority**

Another concern at the inlet structure is the waste being dumped from septic haulers ahead of the raw sewage pumps which is likely causing excess buildup of debris on the bar screens. Based on data provided by the City, approximately 74,023 gallons of hauled waste were dumped at the treatment plant between December 2022 and January 2023. For this amount, the City was paid approximately \$14,880 which equates to approximately \$0.20 per gallon.

One concern with this septic dumping is the fact that the dump location is ahead of the raw sewage pumps. There is a manual bar screen at the dump site. However, it is unlikely that this screen catches all solids material which is evident by the material caught by the bar screens at the inlet structure. While not as easily quantified, the excess wear on the pumps caused by handling the septic debris reduces the life of the pumps, causing increased replacement and maintenance costs. Plant personnel have also indicated that allowing septic haulers to dump takes time away from other duties.

Considering the small amount of revenue generated, which is actually less considering the other factors discussed, it does not appear that allowing septic haulers to dump at the plant produces a meaningful net positive impact on facility operations and financials. It is likely to be a net negative impact, though not a drastic one. Considering this, it is recommended that the City consider revising the current conditions for receiving waste from septic haulers.

### **Grit Removal Facilities – Low Priority**

Construction of a grit removal structure is another consideration for improvements to the facilities. While more likely to be considered a low priority improvement, constructing a grit removal structure is beneficial to plant operations by limiting the amount of solids and grit material that is allowed to make its way through the plant. This reduces the wear on various components of the plant, decreases maintenance, and also improves plant efficiency by mitigating capacity loss due to sediment.

The influent line before the raw sewage pumps is approximately 15' deep. There is also very little room between the raw sewage pumps and the Inlet structure for a grit removal facility to be installed. Considering these factors, it is more reasonable to install a grit removal facility after the raw sewage pumps. More precisely, it appears that the facility could be added to the west side of the existing inlet structure. The existing facility would be modified to direct flow from the western influent channel to the new grit facility. Flow would pass through the grit chamber and back into the existing splitter box upstream of the existing weirs. Table 8-5 provides a cost estimate for the construction of the new facility and the modifications to the existing inlet structure.

**Table 8-5. Cost Estimate for Grit Removal Facility**

| ITEM                              | QUANTITY | UNIT | DESCRIPTION                         | UNIT PRICE    | TOTAL                |
|-----------------------------------|----------|------|-------------------------------------|---------------|----------------------|

### 8.6.5 Oxidation Ditches

#### **Install Retrievable Fine Bubble Diffusers – High Priority**

Considering the condition of the existing Hydro Rotors and the fact that they are not able to supply adequate oxygen for all current and future conditions, replacement of the rotors should be considered a high priority. For a retrofit installation in the existing ditches, retrievable fine bubble diffusers are recommended. The main benefit of these types of diffusers is how much easier they are to maintain. As opposed to a fixed system, whether that be discs or tubes, the retrieval systems are mounted to racks and attached to a guide rail that allows them to be removed from the surface with minimal effort. Another benefit is the efficiency of the system. Being fine bubble allows for greater oxygen transfer efficiency. Further, the use of blowers operating on variable frequency drives and controlled by a DO probe allows for a much more efficient delivery of oxygen to the system.

The equation below can be used to calculate SOR requirements for diffused air systems.

$$SOR = \frac{(AOR)(C_s)}{(\alpha)(F)(\theta^{(T-20)})[(\beta)(C_{sc} - C_L)]}$$

Where:

- SOR is Standard Oxygen Requirement
- AOR is Actual Oxygen Requirement
- $\alpha$  (0.85) is the Oxygen Transfer Correction Factor
- $\beta$  (0.95) is the Salinity – Surface Tension Correction Factor
- $\theta$  (1.024) is the Oxygen Transfer Coefficient
- T (12) is Degrees Celsius Temperature of Water
- $C_{sc}$  (10.5) is the Dissolved Oxygen Concentration at 40% depth at the site elevation and temperature in mg/L
- $C_s$  (9.02) is the Dissolved Oxygen Saturation Concentration in clean water at 20 Degrees C in mg/L
- $C_L$  (2.00) is the Operating Dissolved Oxygen Concentration in mg/L
- F (0.85) is the fouling factor

Considering the AOR requirements for Shoal Creek's current and future conditions established in Table 7-1 and the above equation, Table 8-6 provides diffused air SOR values for the Shoal Creek Plant.

**Table 8-6. Shoal Creek Plant Diffused Air SOR**

|                       | SOR (lb/hr) |
|-----------------------|-------------|
| <b>Current (2023)</b> | 1042        |
| <b>Future (2043)</b>  | 1260        |

Table 8-7 provides a construction cost estimate for the removal of the existing aeration equipment and the installation of retrievable diffuser racks as described.

**Table 8-7. Cost Estimate for Installation of Retrievable Diffusers**

| ITEM                              | QUANTITY | UNIT | DESCRIPTION                    | UNIT PRICE    | TOTAL                  |

### **Increase Oxidation Ditch Drain Size – Low Priority**

The existing 6" lines out of the oxidation ditches that drain back to the head of the plant are reported to be undersized by plant personnel and thus drain the ditches slowly. To increase the rate at which the ditches can be drained, replacing the existing 6" lines with 10" lines is proposed.

Table 8-8 provides a cost estimate for increasing the size of these lines.

**Table 8-8. Cost Estimate for Oxidation Ditch Drain Line Replacement**

| ITEM                              | QUANTITY | UNIT | DESCRIPTION                              | UNIT PRICE   | TOTAL                |

## **8.6.6 Secondary Clarifiers**

### **Install Center Feed Equipment – High Priority**

The condition of the existing clarifier skirts requires that replacement be considered in the near future. More so though, the peripheral feed type of the current facilities is of a dated design. To provide for easier operation and maintenance of the clarifier facilities in addition to simply replacing equipment that has passed the end of its useful life, the installation of center feed type clarification equipment in the existing clarifier basins is proposed. Table 8-9 provides a cost estimate for replacing the existing clarifier equipment with new, center feed equipment.

**Table 8-9. Cost Estimate for Installation of Center Feed Clarifier Equipment**

| ITEM                              | QUANTITY | UNIT | DESCRIPTION                    | UNIT PRICE    | TOTAL                  |

### 8.6.7 *Return Activated and Waste Activated Pump Station*

#### **Renovation of RAS/WAS Pump Station – High Priority**

The condition of the existing facilities is such that renovation is recommended. Similar to the proposed improvements to the raw sewage pumping structure, the conversion to submersible pumps is recommended here as well. Each pump would be equipped with VFD to allow for better control of RAS and more efficient operation. Assuming a RAS rate of 0.75 times the future average daily flow of 2.9 MGD, a firm capacity of approximately 1,550 gpm is required. To achieve this, two pumps capable of producing approximately 1,550 gpm at 30' TDH would be installed. Considering the existing wet wells are two 30" ductile iron pipes, it is expected that two new 4' diameter concrete wet wells will need to be constructed. Table 8-10 provides a cost estimate for renovating the RAS/WAS Pump Station.

**Table 8-10. Cost Estimate for Renovation of RAS/WAS Pump Station**

| ITEM                              | QUANTITY | UNIT | DESCRIPTION                             | UNIT PRICE    | TOTAL                  |

### **8.6.8 Sludge Storage and Disposal**

#### **Replace Aerators and Decant Valving – Low Priority**

While still operable, the floating aerators in the sludge holding tanks are nearing the end of their useful life and should be considered for replacement. The decant valves at the sludge holding tanks are deteriorating and will need to be replaced in the future. Table 8-11 provides a cost estimate for these improvements.

**Table 8-11. Cost Estimate for Replacing Floating Aerators and Decant Valving**

| ITEM                              | QUANTITY | UNIT | DESCRIPTION                           | UNIT PRICE    | TOTAL                |
|-----------------------------------|----------|------|---------------------------------------|---------------|----------------------|
| 1                                 | 1        | LS   | Removal of Existing Improvements      | \$ 15,000.00  | \$ 15,000.00         |

| <b>Construction Cost Estimate</b> |          |      |                                       |               | <b>\$ 445,000.00</b> |

#### **Construct Centrifuge Sludge Handling Facility – Low Priority**

Sludge is currently stored and disposed of by land application. Should the City decide to alter the method of sludge handling, the installation of a centrifuge is a viable option. When using a centrifuge, sludge is mixed in line with a small quantity of polymer to form a floc and is then pumped into a centrifuge that spins at a high speed, pressing the sludge against a screen. This allows the water (centrate) to move through and be discharged back to the treatment stream while the sludge is retained. The sludge cake is then augured to the end opposite of which the centrate is exiting and dropped into a hopper to be conveyed away from the centrifuge.

In addition to the centrifuge equipment, a centrifuge building to house the centrifuge, polymer feed system, and conveyor equipment would need to be constructed. A compost pad with a roof will be needed to store dried solids material. Anticipating that the centrifuge equipment would be constructed near the two smaller sludge holding tanks, one of these tanks would serve as the homogenizing tank from which sludge is pumped into the centrifuge. A mixer would be installed in the tank to achieve uniform consistency. New pumps would be installed to pull sludge from this tank. It is anticipated that the decant from the centrifuge will go to the existing pump station that currently handles decant from the existing sludge holding tanks. Table 8-12 provides an estimated construction cost for the installation of a centrifuge.

**Table 8-12. Cost Estimate for Centrifuge Sludge Handling Facility**

| ITEM                              | QUANTITY | UNIT | DESCRIPTION                      | UNIT PRICE    | TOTAL                  |
|-----------------------------------|----------|------|----------------------------------|---------------|------------------------|

| 13                                | 1        | LS   | Painting                         | \$ 50,000.00  | \$ 50,000.00           |
| 14                                | 1        | LS   | Electrical                       | \$ 260,000.00 | \$ 260,000.00          |
| 15                                | 1        | LS   | Sitework                         | \$ 60,000.00  | \$ 60,000.00           |
| <b>Construction Cost Estimate</b> |          |      |                                  |               | <b>\$ 2,075,000.00</b> |

Based on information provided by the City, it is estimated that the current sludge hauling operation for both plants costs approximately \$60,940 per year including labor, power, materials, maintenance, etc. Assuming half of those costs can be attributed to Shoal Creek, the annual cost to haul sludge for the Shoal Creek plant is \$30,470. A breakdown of these total costs is provided in Appendix E. It can be assumed that the installation of a centrifuge would cut the sludge handling O&M cost for Shoal Creek in half bringing an annual cost savings of approximately \$15,000. Comparing this cost savings to the estimated construction cost, the payback period associated with the installation of a centrifuge is hard to justify from solely a financial perspective.

With a centrifuge, there will be a reduction in the overall amount of sludge that has to be disposed of from the treatment plant. However, the handling and disposal of solid sludge material as opposed to liquid, will require some changes in operations. One such consideration is that it may be more difficult to find a third party to dispose of the solid material rather than liquid. These and other factors are difficult to quantify. If the installation of a centrifuge is something the City wishes to pursue, it is recommended that more discussions take place to further look into the details of the operation relative to the City's expectations and needs.

### 8.6.9 Filtration

#### **Construct Tertiary Filters – Low Priority**

Under circumstances where adequate phosphorus removal is not able to be achieved biologically, then sufficient removal will have to be attained through chemical addition to meet future effluent requirements. In that case, tertiary filters will likely need to be constructed to further remove phosphorus-binding solids from the treated clarifier effluent.

Considering the available space on site, the location of the filters would need to be west of the existing oxidation ditches. This will require a portion of the existing pond to be filled. Further, there is not sufficient elevation drop between the existing clarifiers and the existing UV structure to accommodate the installation of the filters. As such, a new UV structure would need to be constructed further down the outfall sewer. To handle future peak flows, the proposed filters would need a maximum capacity of at least 7.0 MGD.

Table 8-13 provides a cost estimate for the construction of the described tertiary filters.

**Table 8-13. Cost Estimate for Construction of Tertiary Filters**

| ITEM                              | QUANTITY | UNIT | DESCRIPTION                 | UNIT PRICE      | TOTAL                  |

### 8.6.10 UV Disinfection

#### **Replace Existing UV Equipment – Low Priority**

As indicated previously, the existing channels cannot accommodate the installation of slanted UV disinfection equipment. New channels would have to be constructed to allow for this type of equipment to be installed. Considering this, constructing new channels to install a different type of equipment is not thought to be necessary when the existing equipment is adequate for current and future flows. At the time the existing UV equipment needs replacement, simply replacing the equipment is thought to be the more reasonable option. Given that the existing equipment is older, the installation of new UV equipment would require some minor modifications to the existing channels to allow for installation.

If and when the time comes that the existing channels cannot accommodate flows, further consideration can be given to either adding another channel or construction of all new ones to allow for the installation of different UV equipment. Table 8-14 provides a cost estimate for the replacement of the existing UV equipment.

**Table 8-14. Cost Estimate for Replacement of UV Equipment**

| ITEM                              | QUANTITY | UNIT | DESCRIPTION                        | UNIT PRICE    | TOTAL                |
|-----------------------------------|----------|------|------------------------------------|---------------|----------------------|
| 1                                 | 1        | LS   | Removal of Existing Improvements   | \$ 30,000.00  | \$ 30,000.00         |
| 2                                 | 10       | CY   | Concrete for Channel Modifications | \$ 1,000.00   | \$ 10,000.00         |
| 3                                 | 1        | LS   | Replace UV Equipment and Controls  | \$ 450,000.00 | \$ 450,000.00        |
| 4                                 | 1        | LS   | Install Effluent Control Weirs     | \$ 25,000.00  | \$ 25,000.00         |
| 5                                 | 1        | LS   | Electrical                         | \$ 50,000.00  | \$ 50,000.00         |

| <b>Construction Cost Estimate</b> |          |      |                                    |               | <b>\$ 600,000.00</b> |

### **8.6.11 Electrical Facilities**

#### **Install Automatic Transfer Switch – High Priority**

The generator for the Shoal Creek Plant currently does not have an ATS which requires the switch to backup power to be a manual operation. It is recommended that an ATS be installed on the existing generator so that backup power turns on automatically in the event of a power failure. Table 8-15 provides a cost estimate for the installation of an ATS on the existing generator for the Shoal Creek Plant.

**Table 8-15. Cost Estimate for Installing ATS**

| ITEM                       | QUANTITY | UNIT | DESCRIPTION | UNIT PRICE   | TOTAL        |
|----------------------------|----------|------|-------------|--------------|--------------|
| 1                          | 1        | LS   | Install ATS | \$ 50,000.00 | \$ 50,000.00 |
| Construction Cost Estimate |          |      |             |              | \$ 50,000.00 |

### 8.6.12 Improvement Cost Estimate Summary

Table 8-16 provides a summary of the construction costs presented in Section 8.6 for improvements to the existing Shoal Creek Plant. Table 8-16 groups these improvements by priority to present a total estimated construction cost for high, medium, and low priority improvements, as well as a total estimated cost for all improvements. Given that most of the proposed improvements are aimed at providing improved operation and functionality to the existing system, it is not anticipated that there will be an increase in operation and maintenance costs. On the contrary, it is more likely that O&M costs will be decreased. As such, the estimated construction costs presented also reflect the estimated present worth costs.

**Table 8-16. Summary of Cost Estimates for Improvements to Existing Facilities**

| Improvement                                                              | Construction Cost       |
|--------------------------------------------------------------------------|-------------------------|
| <b>High Priority Improvements</b>                                        |                         |
| Raw Sewage Pumping Structure Renovation                                  | \$ 565,000.00           |
| Oxidation Ditch Retrievable Diffuser Installation                        | \$ 2,715,000.00         |
| Clarifier Center Feed Equipment Installation                             | \$ 1,050,000.00         |
| RAS/WAS Pump Station Renovation                                          | \$ 1,010,000.00         |
| Backup Generator ATS Installation                                        | \$ 50,000.00            |
| <b>Total Estimated Construction Cost of High Priority Improvements</b>   | <b>\$ 5,390,000.00</b>  |
| <b>Medium Priority Improvements</b>                                      |                         |
| Crowder Lift Station Renovation                                          | \$ 1,092,000.00         |
| Inlet Structure Slide Gates and Bar Screens Replacement                  | \$ 55,000.00            |
| Reevaluate Septic Dumping at Plant                                       | N/A                     |
| <b>Total Estimated Construction Cost of Medium Priority Improvements</b> | <b>\$ 1,147,000.00</b>  |
| <b>Low Priority Improvements</b>                                         |                         |
| Peak Flow Pump Control Improvements                                      | \$ 150,000.00           |
| Grit Removal Facilities Construction                                     | \$ 922,910.00           |
| Oxidation Ditch Drain Improvements                                       | \$ 154,000.00           |
| Sludge Storage Aerator and Decant Valving Replacement                    | \$ 445,000.00           |
| Centrifuge Sludge Handling Facility Construction                         | \$ 2,075,000.00         |
| Tertiary Filter Construction                                             | \$ 4,120,520.00         |
| UV Disinfection Equipment Replacement                                    | \$ 600,000.00           |
| <b>Total Estimated Construction Cost of Low Priority Improvements</b>    | <b>\$ 8,467,430.00</b>  |
| <b>Total Estimated Construction Cost of All Improvements</b>             | <b>\$ 15,004,430.00</b> |

## 8.7 Improvements for Treating Crowder Flow

In addition to the improvements described in Section 8.6, additional improvements will also need to be implemented if the Shoal Creek Plant is to treat wastewater flow from the Crowder Plant. Like Section 8.6, this section describes the various improvements needed and provides associated cost estimates for construction of the proposed improvements.

### 8.7.1 Flow Equalization Basin

#### **Reroute Crowder Pressure Sewer Line – High Priority**

If Shoal Creek treats wastewater from the Crowder Plant, flow from Crowder would not be screened with the current piping configuration. The current location of the pressure sewer from Crowder, at the inlet structure, is after all of Shoal Creek's screening facilities. To address this, it is recommended that the 16" pressure sewer from Crowder be rerouted at the Shoal Creek flow equalization basin to discharge to a manhole just upstream of the mechanical screen there. This way, all flow entering the Shoal Creek Plant will have been screened by the mechanical screen. Table 8-17 provides a cost estimate for rerouting the pressure sewer.

**Table 8-17. Cost Estimate for Crowder Pressure Sewer Reroute**

| ITEM                              | QUANTITY | UNIT | DESCRIPTION                  | UNIT PRICE   | TOTAL               |
|-----------------------------------|----------|------|------------------------------|--------------|---------------------|
| 1                                 | 1        | EA   | Connect to Existing 16" Line | \$ 15,000.00 | \$ 15,000.00        |
| 2                                 | 100      | LF   | 16" Dia. PVC Pressure Sewer  | \$ 200.00    | \$ 20,000.00        |
| 3                                 | 1        | EA   | Connect to Existing Manhole  | \$ 12,000.00 | \$ 12,000.00        |
| 4                                 | 2        | EA   | 16" Plug Valves              | \$ 15,000.00 | \$ 30,000.00        |
| <b>Construction Cost Estimate</b> |          |      |                              |              | <b>\$ 77,000.00</b> |

## 8.7.2 Raw Sewage Pumping Structure

### **Facility Renovation – High Priority**

Additional capacity will be needed at the raw sewage pumping structure if Shoal Creek is to treat flow from Crowder. If planning to treat flow from the Crowder Plant, a fourth pump would be needed to accommodate peak flows. This would provide a firm capacity of 9,000 gpm (12.96 MGD). Renovating the raw sewage pumping structure as described should be considered a high priority if Shoal Creek is to treat flow from Crowder. Table 8-18 provides a cost estimate for all the same renovation work described in Section 8.6.3 plus the addition of a fourth pump.

**Table 8-18. Cost Estimate for Raw Sewage PS Improvements**

| ITEM                              | QUANTITY | UNIT | DESCRIPTION                      | UNIT PRICE    | TOTAL                |
|-----------------------------------|----------|------|----------------------------------|---------------|----------------------|

| <b>Construction Cost Estimate</b> |          |      |                                  |               | <b>\$ 645,000.00</b> |

### 8.7.3 Inlet Structure

#### **Splitter Box Improvements and Grit Removal Facility – High Priority**

While the current configuration of the inlet structure may create somewhat uneven flow distribution between the existing treatment trains for various reasons, it is not necessarily a cause for concern. However, with the addition of more treatment trains to accommodate flow from Crowder, constructing improvements to control the flow split between facilities will be necessary. Further, it is recommended that a grit removal facility be added as well at the same time as improvements to the inlet structure. This will prevent the need for another addition to the existing facility in the future, saving cost and providing a more cohesive design. The design for the proposed facility is nearly identical to what is described in Section 8.6.4, except it sees the addition of two flow split channels west of the existing ones, just after the proposed grit facility. Table 8-19 provides a construction cost estimate for the proposed improvements.

**Table 8-19. Cost Estimate for Splitter Box and Grit Facility Improvements**

| ITEM                              | QUANTITY | UNIT | DESCRIPTION                         | UNIT PRICE    | TOTAL                  |
|-----------------------------------|----------|------|-------------------------------------|---------------|------------------------|

#### **8.7.4      *Biological Treatment and Clarification***

The existing oxidation ditches and clarifiers do not have sufficient capacity to accommodate the additional flow and loads from the Crowder Plant. To accommodate Crowder's flow, it is necessary to construct additional treatment trains as modifying the existing facilities to meet the increased demand is not practical.

##### **Concentric Basin Extended Aeration System (Phase I) – High Priority**

While the existing facilities are comprised of racetrack style, extended aeration oxidation ditch systems, and separate secondary clarifiers, a concentric style system presents a more efficient design. Due to its use of common walls between the outer oxidation ditch and the inner clarifier, a concentric basin design typically presents significant cost savings compared to systems with separate facilities.

In order to accommodate the projected future flows and loads with the additional flow from Crowder, two additional treatment trains of similar capacity to that of the existing two are proposed. If expansion to handle Crowder's flow is pursued, however, it will likely make sense to construct only a single additional train first, with considerations given for easy future expansion. Planning for construction of the second train would begin once flows and loads are seen increasing towards the projected values.

For Phase I, one concentric basin featuring a 162' diameter oxidation ditch with a 65' diameter inner clarifier would be required for proper biological treatment and clarification. The outer ring of the basin would contain retrievable fine bubble diffuser racks and submersible mixers to maintain velocity in the channel and provide mixing. The inner clarifier basin would have a stainless-steel clarifier mechanism that can be retrieved from the basin, allowing for the mechanism to be exchanged out without taking the entire clarifier offline.

The only space available for the construction of these facilities is the pond west of the existing facilities. As such, construction of additional treatment trains would require filling in this pond or a portion of it and further raising the grade to match that of the existing treatment site. To accomplish this, it is assumed that the area west of the pond as well as the portion of the pond not to be filled can serve as borrow areas for suitable fill material. Considering that it is not known with certainty if or how much of the material from these locations will be suitable for fill, it will be assumed that some fill material must be brought into the site. A geotechnical investigation will be required early in the planning process for these improvements to get a better understanding of the suitability of the soil and subsequently the estimated cost for earthwork.

Sludge would exit the new clarifier to a new RAS/WAS pump station connected to the basin. The pump stations would function in the same manner as the existing one for the other facilities. It would return a portion of the MLSS to the inlet structure with the ability to also waste to the larger sludge holding tank. The treated effluent would exit the clarifier into a junction box before heading to the UV disinfection structure.

Using the same equation from Section 0 for SOR and the AOR values for combined Shoal Creek and Crowder flows from Table 7-1, Table 8-20 provides SOR values for Shoal Creek and Crowder flows for a diffused air system.

**Table 8-20. Shoal Creek and Crowder Plant Diffused Air SOR**

|                       | SOR (lb/hr) |
|-----------------------|-------------|
| <b>Current (2023)</b> | 2034        |
| <b>Future (2043)</b>  | 2461        |

Presented in Table 8-21 are the design parameters for one proposed concentric basin extended aeration system. Table 8-22 provides a construction cost estimate for building the first treatment train (Phase I) to accommodate flow from Crowder.

**Table 8-21. Concentric Basin Design Parameters**

| Oxidation Ditch                                          |      |
|----------------------------------------------------------|------|
| Channel Width (ft)                                       | 47   |
| Channel Total Depth (ft)                                 | 14   |
| Channel Side Water Depth (ft)                            | 12   |
| Basin Outer Diameter (ft)                                | 162  |
| Basin Inner Diameter (ft)                                | 68   |
| Wall Thickness (ft)                                      | 1.5  |
| Basin Total Volume (MG)                                  | 1.78 |
| Basin Total Effective Volume (MG)                        | 1.52 |
| Max BOD <sub>5</sub> Capacity (lb BOD <sub>5</sub> /day) | 6110 |
| Peak Hydraulic Capacity (MGD)                            | 4.57 |
| Oxygen Supply Capacity (lb O <sub>2</sub> /hr)           | 625  |
| Clarifier                                                |      |
| Basin Diameter (ft)                                      | 65   |
| Basin Total Depth (ft)                                   | 14   |
| Basin Side Water Depth (ft)                              | 12   |
| Basin Surface Area (ft <sup>2</sup> )                    | 3318 |
| Basin Total Volume (MG)                                  | 0.35 |
| Basin Effective Volume (MG)                              | 0.30 |
| Hydraulic Capacity (MGD)                                 | 3.32 |

### **Concentric Basin Extended Aeration System (Phase II) – Low Priority**

As described, constructing the second concentric basin should not be pursued initially as current demands do not require it. However, flows and loads should be assessed progressing into the future to determine if and when the construction of Phase II should be implemented. The design of the second basin will be nearly identical to the first, with only slight variations due to orientation. Phase I will have been constructed with considerations for the addition of Phase II to provide some cost savings. However, it will be assumed that more fill material will need to be brought in for Phase II than for Phase I as less suitable on-site material will likely be available. Table 8-23 provides a construction cost estimate for the construction of the second basin.

**Table 8-23. Cost Estimate for Concentric Basin Extended Aeration System (Phase II)**

### 8.7.5 Sludge Storage and Disposal

#### **Construct Additional Sludge Storage – High Priority**

While the Shoal Creek Plant's existing sludge storage facilities have adequate capacity for current and future conditions for Shoal Creek, the facilities are not enough to accommodate flows from Crowder. As such, storage providing a minimum of 21 additional days of storage is required to have at least 120 days of storage. It is recommended that 30 days of additional storage be constructed. Future Shoal Creek and Crowder sludge generation is estimated to be approximately 7,760 gpd. At this rate, approximately 232,800 gallons of additional storage will be required. Considering space, it is proposed that the new tank be constructed in the open area near the two smaller sludge storage tanks. To achieve the necessary volume, it is recommended that a 65' diameter by 11' deep tank be constructed to be of similar depth to the existing two tanks.

Table 8-25 provides a cost estimate for the construction of the proposed sludge storage tank.

**Table 8-25. Cost Estimate for Sludge Storage Tank**

### **Construct Centrifuge Sludge Handling Facility – Medium Priority**

Constructing a centrifuge does provide a benefit if Shoal Creek were to treat Crowder's flow. Having this facility would make it so that the plant is not completely dependent on land application for disposing of its waste. In doing so, the plant would not be required to have a minimum of 120 days of storage. This does not provide much meaningful benefit for the Shoal Creek Plant alone since existing sludge storage is adequate. However, this eliminates the need to construct additional sludge storage if treating flow from Crowder. Table 8-26 provides a construction cost estimate for the construction of a centrifuge facility to accommodate sludge from both the Shoal Creek and Crowder plants.

**Table 8-26. Cost Estimate for Construction of Centrifuge Sludge Handling Facility**

| 13                                | LS           | 1               | Painting                         | \$ 50,000.00      | \$ 50,000.00           |
| 14                                | LS           | 1               | Electrical                       | \$ 285,000.00     | \$ 285,000.00          |
| 15                                | LS           | 1               | Sitework                         | \$ 60,000.00      | \$ 60,000.00           |
| <b>Construction Cost Estimate</b> |              |                 |                                  |                   | <b>\$ 2,275,000.00</b> |

Considering an annual O&M cost for sludge hauling of approximately \$60,490, it is assumed that the construction of a centrifuge will provide for an estimated 50% reduction in operating costs or an annual savings of approximately \$30,000. Considering this and counting the cost of constructing a new sludge storage tank (Table 8-25) as a reduction from the cost provided in Table 8-26, it is estimated that it will take 40 years for the City to recoup the money associated with constructing a centrifuge. Even with the cost savings associated with not needing to construct an additional sludge storage tank, it is still a long payback period for the City to recoup its

investment in a centrifuge. As such, the City should have further discussions as to the needs for and benefits of installing a centrifuge to determine if it is an improvement they want to pursue for reasons outside of the financial considerations provided here.

### 8.7.6 Filtration

#### **Construct Tertiary Filters – Low Priority**

For the same reasons described previously in Section 8.6.9, tertiary filters may be needed in the future if adequate phosphorus removal cannot be achieved biologically. For also treating flow from Crowder, 12.0 MGD of filtration capacity will be needed. The proposed filter building would be constructed north of the proposed concentric aeration and clarification basins and west of the existing oxidation ditches, requiring more of the existing pond to be filled.

Table 8-27 provides a construction cost estimate for the construction of the tertiary filters.

**Table 8-27. Cost Estimate for Construction of Tertiary Filters**

### 8.7.7 UV Disinfection

#### **Construct UV Disinfection Structure – High Priority**

As discussed previously, the capacity of the existing UV structure is adequate for current and future Shoal Creek flows. However, the current and future combined peak flows for both Shoal Creek and Crowder are such that additional capacity will be needed. In order to consolidate facilities, it is recommended that a new UV structure with the capacity to treat flow from the entire plant be constructed. To do this, a facility with the ability to be expanded to a capacity of 12.0 MGD by installing additional UV equipment would be constructed downstream of the point where discharge from the two proposed concentric basins ties into the existing 24" effluent line. This new UV structure will need to be constructed at an elevation that allows for the installation of possible future filters to tie in, which may require lowering the existing outfall sewer. The existing UV structure would then be abandoned.

Table 8-28 provides a cost estimate for the construction of a new UV structure.

**Table 8-28. Cost Estimate for UV Disinfection Structure**

| ITEM                              | QUANTITY | UNIT | DESCRIPTION                          | UNIT PRICE    | TOTAL                  |

### 8.7.8 *Electrical Facilities*

#### **Construct Control Building and Install Generator – High Priority**

Considering the additional equipment associated with the proposed expansion of the treatment facilities, it will be necessary to construct a second control building to house controls for the proposed as well as any future improvements. Additionally, the existing generator at the Shoal Creek Plant will need to be replaced with a larger unit to provide adequate backup power to the existing facilities along with the proposed improvements. Table 8-29 provides a cost estimate for a new control building and generator.

**Table 8-29. Cost Estimate for New Control Building and Generator**

| ITEM                              | QUANTITY | UNIT | DESCRIPTION      | UNIT PRICE    | TOTAL                |
|-----------------------------------|----------|------|------------------|---------------|----------------------|
| 1                                 | 600      | SF   | Control Building | \$ 250.00     | \$ 150,000.00        |

| <b>Construction Cost Estimate</b> |          |      |                  |               | <b>\$ 560,000.00</b> |

### 8.7.9 *Miscellaneous Improvements to Crowder Facilities*

It is anticipated that some additional improvements will also have to be made to the existing Crowder Wastewater Treatment Plant in order to decommission it. For cost estimating purposes, it will be assumed that the existing treatment facilities will have to be closed and most of the equipment removed.

Flow from the head of the plant will also have to be diverted around the existing facilities to make its way to the Crowder Lift Station. Fortunately, operational personnel have indicated that such a line already exists. While most of this line is indicated to be 24" diameter pipe, some is indicated as being smaller than that. As such, these smaller runs of pipe will have to be replaced. It is also not known what condition the existing pipe is in. Most of the pipes are thought to be VCP, so it is likely that the pipe is not in the best condition. For these reasons, it will be assumed that all pipes will need to be replaced. Prior to design, the existing pipe should be inspected to determine its condition. If its condition is adequate, then less pipe will need to be replaced. For budgeting purposes though, the cost estimate will assume all pipes need replacement. Table 8-30 provides an estimated construction cost for these improvements.

**Table 8-30. Cost Estimate for Miscellaneous Improvements to Crowder WWTP**

| ITEM                              | QUANTITY | UNIT | DESCRIPTION                          | UNIT PRICE    | TOTAL                |

### 8.7.10 Improvement Cost Estimate Summary

Table 8-31 provides a summary of the construction costs presented in Section 8.7 for improvements needed at the existing Shoal Creek Plant to be able to treat wastewater flow from the Crowder Plant. Table 8-31 groups improvements by priority to present a total estimated construction cost for high, medium, and low priority improvements, as well as a total estimated cost for all improvements. Some of the proposed improvements reflect the construction of additional facilities that will certainly require operation and maintenance that is not now required at the Shoal Creek Plant. However, at the time that the Shoal Creek Plant is treating flow from Crowder, the Crowder Plant will be out of operation. As such, any increase in operation and maintenance costs would be expected to be more than offset by no longer needing to operate the Crowder Plant. In this case, with no expected net increase in O&M costs, the construction costs presented would also be considered the same as the present worth costs.

**Table 8-31. Summary of Cost Estimates for Facility Expansion**

| <b>Improvement</b>                                                       | <b>Construction Cost</b> |
|--------------------------------------------------------------------------|--------------------------|
| <b>High Priority Improvements</b>                                        |                          |
| Crowder Pressure Sewer Line Reroute                                      | \$ 77,000.00             |
| Raw Sewage Pumping Structure Renovation                                  | \$ 645,000.00            |
| Grit Removal Facility Construction and Splitter Box Improvements         | \$ 1,093,450.00          |
| Concentric Basin Extended Aeration System Construction - Phase I         | \$ 7,162,080.00          |
| Additional Sludge Storage Construction                                   | \$ 928,550.00            |
| UV Disinfection Structure Construction                                   | \$ 1,631,625.00          |
| Control Building Construction & Generator Installation                   | \$ 560,000.00            |
| Miscellaneous Improvements to Crowder WWTP                               | \$ 614,000.00            |
| <b>Total Estimated Construction Cost of High Priority Improvements</b>   | <b>\$ 12,711,705.00</b>  |
| <b>Medium Priority Improvements</b>                                      |                          |
| Centrifuge Sludge Handling Facility Construction                         | \$ 2,275,000.00          |
| <b>Total Estimated Construction Cost of Medium Priority Improvements</b> | <b>\$ 2,275,000.00</b>   |
| <b>Low Priority Improvements</b>                                         |                          |
| Concentric Basin Extended Aeration System Construction - Phase II        | \$ 7,136,900.00          |
| Tertiary Filter Construction                                             | \$ 4,854,520.00          |
| <b>Total Estimated Construction Cost of Low Priority Improvements</b>    | <b>\$ 11,991,420.00</b>  |
| <b>Total Estimated Construction Cost of All Improvements</b>             | <b>\$ 26,978,125.00</b>  |

## **9.0 RECOMMENDATIONS**

### **9.1 Improvements to Existing Facilities**

Many of the existing facilities at the Shoal Creek Plant are well past the end of their useful life, requiring regular maintenance and repair. In order to maintain proper function and ensure continued compliance with the facility's operating permit, improvements to the plant should be pursued. Section 8.6 describes various improvements that could be implemented to the existing facilities to meet current and future needs. While all improvements discussed are of benefit, not all are of equal importance. Considering this, it is recommended that the improvements identified as a high priority in Section 8.6 are pursued at a minimum. These improvements reflect upgrades and replacements of key components at the treatment facility.

The fact that these facilities have ongoing maintenance needs due to their age presents serious operational challenges for plant personnel. Implementation of the high priority improvements will correct major deficiencies at the plant, providing a boost to operational effectiveness and to the ability of the facilities to handle future system demands. Table 9-1 provides a total project cost estimate for the recommended high priority improvements. Figure 9-1 shows a general layout of the recommended high priority improvements to the existing Shoal Creek WWTP facilities.

**Table 9-1. Cost Estimate for Recommended Improvements to Existing Facilities**

| <b>Improvement</b>                                    | <b>Construction Cost</b> |
|-------------------------------------------------------|--------------------------|
| Raw Sewage Pumping Structure Renovation               | \$ 565,000.00            |
| Oxidation Ditch Retrievable Diffuser Installation     | \$ 2,715,000.00          |
| Clarifier Center Feed Equipment Installation          | \$ 1,050,000.00          |
| RAS/WAS Pump Station Renovation                       | \$ 1,010,000.00          |
| Backup Generator ATS Installation                     | \$ 50,000.00             |
| <b>Construction Cost Subtotal</b>                     | <b>\$ 5,390,000.00</b>   |
| Contingency (10%)                                     | \$ 539,000.00            |
| Engineering - Facility Plan Revisions for SRF Program | \$ 25,000.00             |
| Engineering - Rate Study Update                       | \$ 20,000.00             |
| Engineering - Survey                                  | \$ 20,000.00             |
| Engineering - Design                                  | \$ 427,300.00            |
| Engineering - Bidding                                 | \$ 20,000.00             |
| Engineering - Construction                            | \$ 174,900.00            |
| Engineering - Resident Project Representation*        | \$ 222,500.00            |
| Engineering - Start-Up Services                       | \$ 15,000.00             |
| Engineering - Follow-Up Services                      | \$ 15,000.00             |
| Engineering - O&M Manual Update                       | \$ 35,000.00             |
| Legal, Abstract, Title Work                           | \$ 20,000.00             |
| Loan Fee (5%)                                         | \$ 346,185.00            |
| <b>Total Project Cost</b>                             | <b>\$ 7,269,885.00</b>   |

RECOMMENDED IMPROVEMENTS TO EXISTING FACILITIES  
SHOAL CREEK WASTEWATER TREATMENT PLANT EVALUATION  
NEOSHO, MISSOURI

FIGURE

**9-1**

## **9.2 Improvements for Treating Crowder Flow**

Should the City desire to consolidate its treatment facilities by decommissioning the Crowder Plant and sending its flow to the Shoal Creek Plant for treatment, the construction of additional facilities will be needed at the Shoal Creek Plant. As such, most of the improvements described in Section 8.7 are considered high priority as they are necessary for allowing this to happen. Without these high priority improvements at the Shoal Creek Plant, the Crowder Plant must remain operational.

Given that the construction of additional facilities to treat flow from Crowder does not forgo the need for the high priority improvements on the existing system, the improvements from Section 9.1 will still be needed as part of this project as well. Table 9-2 provides a total project cost estimate for all improvements necessary to the existing facilities as well as those needed for Shoal Creek to treat flow from Crowder. Figure 9-2 provides a general layout of the improvements necessary for the Shoal Creek Plant to be able to treat the additional wastewater flow from the Crowder Plant.

**Table 9-2. Cost Estimate for Recommended Improvements Treating Crowder Flow**

| <b>Improvement</b>                                               | <b>Construction Cost</b> |
|------------------------------------------------------------------|--------------------------|
| Raw Sewage Pumping Structure Renovation                          | \$ 645,000.00            |

RECOMMENDED IMPROVEMENTS FOR TREATING CROWDER FLOW  
SHOAL CREEK WASTEWATER TREATMENT PLANT EVALUATION  
NEOSHO, MISSOURI

FIGURE

**9-2**

## 10.0 FUNDING

Based on the provided actual values for Fiscal Year 2022, the City reported wastewater system income and expenses to be approximately \$2,200,061 and \$2,846,015, respectively. As part of these expenses, the City also has approximately \$341,225 in annual debt service. Based on the financial data provided for FY 2022, operation and maintenance expenses total to be approximately \$1,129,620.

The City currently has \$2,209,700 in debt service for the sanitary sewer system at the end of FY23. The original loan amount was \$5,488,800, covering several interceptor projects, I&I abatement efforts, and the peak flow equalization and pumping station improvements. The annual payment on the remaining debt service is \$341,225, making the anticipated payoff date for the debt service the year 2030. Additional financial information for the wastewater collection and treatment system has been included in Appendix F. The following paragraphs represent potential funding opportunities applicable to completing this abatement plan in an accelerated manner.

The State of Missouri Clean Water State Revolving Fund (CWSRF) program provides low-interest loans to qualifying cities to construct wastewater facilities. The loan is secured by bonds that are voted by residents of the City and are subsequently sold to the authority that manages the program. SRF loan interest rates are about 70% below the market rate, plus an annual administrative fee of 0.5%, on a 20-year term. Based on current bond markets, it appears that a 2% net cost of borrowing could reasonably be anticipated by the City via SRF participation; includes all loan fees associated with the program and is significantly lower than the bond costs for projects financed outside the SRF program. The SRF program also has provisions for grant funding, but there is no set amount, and in recent years availability of grants has been very limited.

Potential grant funding should be pursued at the time the City moves forward with a project, however, due to uncertainty as to their availability, they cannot be counted on in a funding plan. In order to be eligible for the SRF program, the City would need to pass a bond issue for the amount of the proposed loan and apply it to the program. There is no fee associated with the application to apply to the program.

One grant fund option is the CWSRF Affordability Grant through MDNR which provides up to \$2,000,000 or 50% of the eligible project costs. This grant would be in conjunction with a low-interest CWSRF loan. CWSRF interest rates are 30% of The Bond Buyer's 25-Revenue Bond Index. The City would need to have a complete facility plan and documentation of an acceptable debt instrument in place at the time of application to be considered for grant eligibility. CWSRF

applications are due March 1 of each year and are available at: <https://dnr.mo.gov/document-search/clean-water-state-revolving-fund-loan-application-mo-780-1951>.

Additionally, MDNR offers a Water Quality Incentive (WQI) Grant of up to \$1,000,000 for qualifying project costs, not to exceed 50 percent of the total funding request. Similar to the CWSRF Affordability Grant, this grant would also be in conjunction with a low-interest CWSRF loan and would require a complete facility plan and documentation of a debt instrument in place at the time of application to be considered for grant eligibility.

It should also be noted that applicants with projects eligible for a CWSRF loan with an Affordability Grant may receive that grant as well as a WQI grant for qualifying project costs if the total funding request is over \$4,000,000 and the CWSRF loan is at least \$2,000,000.

According to the SRF eligibility evaluation form, the City of Neosho would most likely not be eligible for a CWSRF Affordability or Water Quality Grant. The City's eligibility is based on population, unemployment rate, median household income (MHI) compared to the state average, proposed user rates as a percentage of MHI, percentage of households below the poverty level, and the population trend over the last ten years. To be eligible, the City needs to score 195 points based on these criteria. Based on the available information, the City currently appears to only score 80 points. While receiving some points for MHI and poverty level, the City's population is too large, the unemployment rate is too low, the monthly sewer rate is too low, and growth is expected to increase which awards the City zero points in those areas. While the City does not appear eligible, eligibility should and will be verified by MDNR upon review of the funding application for a loan. Applications for the CWSRF funding can be submitted directly to the Missouri Department of Natural Resources at: [fac@dnr.mo.gov](mailto:fac@dnr.mo.gov) or P.O. Box 176, Jefferson City, MO 65102-0176, ATTN: Financial Assistance Center.

A typical alternative to procuring a low-interest loan through the SRF program is to look for financial assistance through the Rural Development grant and loan program. The Rural Development loans typically have a similar or slightly higher interest rate than the SRF loan and offer a longer term. The SRF program also offers extended-term financing at an additional 0.25% interest (term not to exceed the useful life of the asset being financed). However, the Rural Development program requires that the community has a population of 10,000 or less. Given that Neosho's population is greater than this, the City would not be eligible for the program.

Rural Development grants also typically require communities to raise their average rate to 2% of the median household income (MHI) while eligibility for CWSRF grants is affected by this criteria as well. For Neosho, the MHI is currently in the range of \$49,301 based on US Census Bureau

statistics. To be eligible for RD grant funding, the average monthly user rate would need to be at least \$82.17 for 5,000 gallons of usage.

The City of Neosho's current rates are as follows:

- Base fee: \$13.52
- Per 1,000 gallons thereafter: \$5.06
- Average for 5,000 gallons = \$38.82

The current average rate appears to be \$38.82, which is less than the 1% of the MHI, thus, well below 2% of the MHI. As such, it's likely that the community would not be eligible for Rural Development grants without a rate increase even if the City had a population of less than 10,000. As mentioned, having higher rates also increases the points awarded to the City for grant fund eligibility through the SRF Program.

The Community Development Block Grant (CDBG) program is another opportunity for grant funds. However, funds are only available to be used as gap funding meaning they must be paired with another funding source to cover costs above funds that are available from the first source. CDBG grants require the community to have greater than 51% of their residents impacted by the project be in the low to moderate-income range. Based on 2015 U.S. Census Bureau information, approximately 47.46% of the City's residents were considered to be in the low to moderate-income bracket, making the City ineligible to receive CDBG grant funding. It should be noted that it is possible to revise the City's LMI value by conducting an income survey. If completed and the survey shows an LMI value greater than 51%, the City would then be eligible for CDBG funds. Should the City pursue CDBG funding, Lyric Stotler with the Department of Economic Development can be contacted at [Lyric.Stotler@ded.mo.gov](mailto:Lyric.Stotler@ded.mo.gov) or (573) 751-2028 or Carrie Campbell with the Harry S. Truman Coordinating Council at [ccampbell@hstcc.org](mailto:ccampbell@hstcc.org) to obtain more information.

In order to be eligible for funding, bonds would need to be passed to cover the total cost of the project if the City does not have adequate unobligated bonds available. If passing a bond issue is required and thought to be problematic, a lease purchase could be considered. In recent years communities have chosen this option over the SRF program in some cases due to the competitive rates that are not much higher than the SRF program currently. There are also fewer requirements and paperwork to qualify for a lease purchase, which can be attractive for some communities.

Considering the City's recent financial information and the size of the proposed project, it should be expected that a rate increase will be necessary to cover the associated costs regardless of the funding source or method.

## 10.1 Estimated Impact on Rates

In order to help the City evaluate its options, this section provides an estimate of the potential impact on sewer rates associated with funding each project. While the values provided here are useful for estimating possible rate changes in general, it will be necessary for a proper rate study to be completed prior to proceeding with a project to assess rate impacts more accurately. Because it appears unlikely that the City will be eligible for grant funds, the rate assessments provided reflect funding all project costs with a low-interest loan. The provided calculations also assume the rate increase will be enough to cover the entirety of the loan payment and does not account for utilizing any existing City funds or income to cover the cost.

Table 10-1 provides an estimated impact on rates should the City have a project to improve the existing facilities, as described in Section 9.1. Table 10-2 provides an estimated impact on rates should the City a project to improve the existing facilities, as described in Section 9.2.

**Table 10-1. Existing Facility Improvement Project Rate Analysis**

| ITEM                            | Loan Only<br>(30 Yr) | Loan Only<br>(20 Yr) |
|---------------------------------|----------------------|----------------------|
| Total Project Cost              | \$7,269,885.00       | \$7,269,885.00       |
| Grant Amount                    | \$0.00               | \$0.00               |
| Loan Amount                     | \$7,269,885.00       | \$7,269,885.00       |
| Annual Interest Rate            | 2%                   | 2%                   |
| Loan Period (Years)             | 30                   | 20                   |
| Annual Payment                  | \$324,237.00         | \$444,917.00         |
| Total Interest Paid             | \$2,457,225.00       | \$1,628,455.00       |
| Total Loan Cost                 | \$9,727,110.00       | \$8,898,340.00       |
| Average Monthly Rate Increase   | \$5.71               | \$7.83               |
| New Average Rate/Mo.            | \$44.53              | \$46.65              |
| New Average Rate Percent of MHI | 1.08%                | 1.14%                |

**Table 10-2. Improvements for Treating Crowder Flow Project Rate Analysis**

| ITEM                            | Loan Only (30 Yr) | Loan Only (20 Yr) |
|---------------------------------|-------------------|-------------------|
| Total Project Cost              | \$22,778,255.00   | \$22,778,255.00   |
| Grant Amount                    | \$0.00            | \$0.00            |
| Loan Amount                     | \$22,778,255.00   | \$22,778,255.00   |
| Annual Interest Rate            | 2%                | 2%                |
| Loan Period (Years)             | 30                | 20                |
| Annual Payment                  | \$1,015,910.00    | \$1,394,029.00    |
| Total Interest Paid             | \$7,699,045.00    | \$5,102,325.00    |
| Total Loan Cost                 | \$30,477,300.00   | \$27,880,580.00   |
| Average Monthly Rate Increase   | \$17.88           | \$24.54           |
| New Average Rate/Mo.            | \$56.70           | \$63.36           |
| New Average Rate Percent of MHI | 1.38%             | 1.54%             |

## **11.0 ANTIDegradation REVIEW**

Modification of the Shoal Creek Wastewater Treatment Plant may require that the Missouri Antidegradation Rule and Implementation Procedure be complied with prior to the issuance of a new construction or operating permit for the facility. This is more likely to be true for the improvements needed to treat wastewater from the Crowder Plant considering the capacity of the Shoal Creek Plant will be increased. As a part of the antidegradation review process, effluent limits must be derived for the expanded treatment plant, and evidence must be provided to MDNR showing that the anticipated increase in effluent discharge will not result in the degradation of Shoal Creek.

## **12.0 ENVIRONMENTAL INFORMATION**

As a requirement of the environmental review of Clean Water State Revolving Fund (SRF) projects, the facilities plan must include environmental information as set forth in 10 CSR 20-4.050(2)(B). Several specific items were not included in the previous sections of this report and are therefore discussed herein.

### **12.1 Irreversible and Irretrievable Commitment of Resources**

Construction of the proposed project, as with any typical construction effort of this type, would involve the use of fossil fuels, primarily for the operation of construction vehicles and equipment. Additionally, and to a lesser degree, future operation and maintenance of the facility would require the commitment of additional energy resources. A portion of the electrical power to the facility is likely generated from fossil fuels which could be considered irreversible and irretrievable.

Under the proposed project, currently undeveloped areas may be converted to structures, and driving surfaces, resulting in the potential loss of topsoil. During construction, building materials such as concrete, asphalt, steel, wire, wood, plastic, etc. will be utilized resulting in an irreversible loss of these materials.

Finally, the proposed improvements to the wastewater treatment plant will allow for adequate wastewater treatment facilities for the City of Neosho, resulting in an ability to accommodate additional growth. The factors combined to allow such development would likely result in a long-term conversion of currently undeveloped lands to residential and other land uses.

### **12.2 Future Environment Without the Project**

The future environmental conditions in the Neosho area under the “no project” alternative are important to the planning process. No changes in topography, geology, climate, or hydrology are anticipated to occur with or without the project. The greatest potential effects will be on water quality and demographics.

The primary purpose of this study is to set forth recommended improvements to Neosho’s wastewater system to allow the treatment facility’s ability to continue to meet regulatory effluent limitations. Whether wastewater flows and loads increase or stay the same, the quality of effluent from the existing facilities can be expected to deteriorate due to the aging of the plant equipment. As effluent quality approaches the permit limits, development in Neosho will be curtailed, either by the City or by State mandate, until provisions are made to upgrade the plant to meet effluent limits.

### **12.3 Potential Environmental Impacts**

The only unavoidable adverse impacts resulting from the selected plan are short-term noise and minor air pollution caused by construction equipment necessary to complete the project. The project itself will not produce air pollution, objectionable odors, or noise pollution, nor will it relocate any citizens. Any archaeological or cultural sites that may be unearthed during construction will be adequately inspected and cultural material will be salvaged, if warranted, by trained archaeologists. Construction of the improvements is not expected to substantially change present land use patterns, and no significant environmental impacts are anticipated as a result of this expansion.

### **12.4 Short-Term Uses Versus Long-Term Productivity**

Construction of the proposed facilities would result in short-term construction-related impacts such as interference with local traffic, limited air emissions, increase in ambient noise levels, dust generation, disturbance of wildlife, and increased storm runoff. These impacts would be temporary and would occur only during construction. They are not expected to alter the long-term productivity of the natural environment.

The project would assist in the long-term productivity of the Neosho area by supporting the adequacy of the City's wastewater treatment facilities, thereby allowing continued growth and economic development in and around the City. The long-term benefits of the proposed project outweigh the mitigable short-term impacts to the environment resulting from project construction.

## **Appendix A – Current Missouri State Operating Permit**

STATE OF MISSOURI  
DEPARTMENT OF NATURAL RESOURCES  
MISSOURI CLEAN WATER COMMISSION

## MISSOURI STATE OPERATING PERMIT

In compliance with the Missouri Clean Water Law, (Chapter 644 R.S. Mo. as amended, hereinafter, the Law), and the Federal Water Pollution Control Act (Public Law 92-500, 92<sup>nd</sup> Congress) as amended,

|                                 |                                                                                     |
|---------------------------------|-------------------------------------------------------------------------------------|
| Permit No.                      | MO-0104906                                                                          |

| First Classified Stream and ID: | See Page 2.                                                                         |
| USGS Basin & Sub-watershed No.: | See Page 2.                                                                         |

is authorized to discharge from the facility described herein, in accordance with the effluent limitations and monitoring requirements as set forth herein:

### FACILITY DESCRIPTION

See Page 2.

This permit authorizes only wastewater and stormwater discharges under the Missouri Clean Water Law and the National Pollutant Discharge Elimination System; it does not apply to other regulated areas. This permit may be appealed in accordance with Section 621.250 RSMo, Section 640.013 RSMo and Section 644.051.6 of the Law.

May 1, 2017  
Effective Date

  
Steven Feeler, Acting Director, Division of Environmental Quality

April 30, 2022  
Expiration Date

  
David J. Lamb, Acting Director, Water Protection Program

## **FACILITY DESCRIPTION (continued):**

This permit includes two wastewater treatment facilities which serve the City of Neosho. These facilities were previously permitted separately – Neosho Crowder WWTP (MO-0039926) and Neosho Shoal Creek WWTP (MO-0104906). During normal operations at the Neosho Crowder WWTP, effluent is sent to the Neosho Shoal Creek WWTP, where effluent from the two plants mix together prior to the ultraviolet disinfection unit at the Neosho Shoal Creek WWTP. Therefore, it has been determined by the permit writer that combining the two permits into one permit is appropriate. The use or operation of this facility shall be by or under the supervision of a Certified A Operator.

### **Outfall #001 – Main Facility Outfall at Neosho Shoal Creek WWTP – POTW – SIC #4952**

Flow equalization basin / bar screen / 2 oxidation ditches / 2 final clarifiers / ultraviolet disinfection / aerobic sludge digester / 2 aerated sludge holding basins / sludge is land applied. Ultraviolet disinfection system has a design flow capability of 6 MGD to treat combined effluent flows from both the Neosho Shoal Creek WWTF and the Neosho Crowder WWTF.

Design population equivalent is 30,000.

Design flow is 3.0 MGD.

Actual flow is 1.7 MGD.

Design sludge production is 630 dry tons/year.

|                                 |                                                |
|---------------------------------|------------------------------------------------|
| Legal Description:              | SE ¼, SE ¼, Sec. 12, T25N, R32W, Newton County |
| UTM Coordinates:                | X= 377523, Y= 4084102                          |
| Receiving Stream and ID:        | Shoal Creek (P) (3222) 303(d) List             |
| First Classified Stream and ID: | Shoal Creek (P) (3222) 303(d) List             |
| USGS Basin & Sub-watershed No.: | (11070207-0804)                                |

### **Outfall #002 – Discharge at Neosho Crowder WWTP (previously permitted as Outfall #001 in MO-0039926)**

Flow equalization basin / bar screen / 2 pre-aeration basins / 2 primary clarifiers / 3 trickling filters / recirculation basin / 3 secondary clarifiers / chlorine disinfection / chlorine contact basin / dechlorination / 2 primary aerobic sludge digesters / sludge drying bed / sludge is land applied.

Design population equivalent is 29,000.

Design flow is 3.0 MGD.

Actual flow is 0.92 MGD.

Design sludge production is 812 dry tons/year.

|                                 |                                                |
|---------------------------------|------------------------------------------------|
| Legal Description:              | SW ¼, SE ¼, Sec. 09, T24N, R32W, Newton County |

### **Outfall #003 – Discharge Point to the Golf Course Irrigation Storage Ponds**

This location has been identified in the permit in order to document the location at which effluent from the Neosho Crowder WWTP is discharged to the golf course irrigation storage ponds. Effluent discharged from Outfall #003 receives the same treatment as effluent discharged from Outfall #002. This permit does not include final effluent limitations for this location, as effluent sampling is not possible at the storage ponds. However, Internal Monitoring Point #IP2 has been created by the permit writer in order to monitor effluent quality prior to the discharge to at Outfall #003.

|                                 |                                                |
|---------------------------------|------------------------------------------------|
| Legal Description:              | SE ¼, NW ¼, Sec. 35, T25N, R32W, Newton County |
| UTM Coordinates:                | X= 374823, Y= 4078567                          |
| Receiving Stream:               | Tributary to Buffalo Creek (losing)            |
| First Classified Stream and ID: | 8-20-13 MUDD V1.0 (C) (3960) (losing)          |
| USGS Basin & Sub-watershed No.: | (11070208-0401)                                |

### **Internal Monitoring Point #IP1 – Influent Monitoring Location for Neosho Crowder WWTP**

Internal Monitoring Point #IP1 is the location where influent monitoring of the Neosho Crowder WWTP shall take place. Influent monitoring at this location is necessary in order to determine the removal efficiency of the Neosho Crowder WWTP prior to the mixing of the two effluents at the Neosho Shoal Creek WWTP.

|                    |                                                |
|--------------------|------------------------------------------------|
| Legal Description: | NE ¼, NE ¼, Sec. 16, T24N, R32W, Newton County |
| UTM Coordinates:   | X= 376928, Y= 4075240                          |

**Internal Monitoring Point #IP2 – Effluent Monitoring Location for Neosho Crowder WWTP – Golf Course Irrigation Storage Ponds**

Internal Monitoring Point #IP2 is the location where effluent monitoring of the Neosho Crowder WWTP shall take place when effluent is being sent to the golf course irrigation storage ponds. Water storage at the golf course includes three (3) interconnected storage ponds, the last of which, has the potential to discharge. If a discharge did occur from the final storage pond, the water being discharged would not be representative of the effluent contribution from the Neosho Crowder WWTP as there are other sources contributing to the storage ponds. Therefore, it has been determined by the permit writer that effluent must be monitored prior to the discharge to the golf course irrigation storage ponds in order to determine compliance with final effluent limitations. Due to the fact that there is no location for sample collection once effluent is being routed to the golf course irrigation ponds, the location of Internal Monitoring Point #IP2 is in the chlorine contact basin, where effluent has been subject to the full treatment of the Neosho Crowder WWTP.

Legal Description: NE ¼, NE ¼, Sec. 16, T24N, R32W, Newton County  
UTM Coordinates: X= 376753, Y= 4075394

**Internal Monitoring Point #IP3 – Effluent Monitoring Location During Normal Operations for Neosho Crowder WWTP**

Internal Monitoring Point #IP3 is the location where effluent monitoring of the Neosho Crowder WWTP shall take place when effluent is being sent to the Neosho Shoal Creek WWTP. Effluent from the Neosho Crowder WWTP mixes with effluent from the Neosho Shoal Creek WWTP just prior to the ultraviolet disinfection unit at the Neosho Shoal Creek WWTP. Prior to the mixing of the two effluents, the permittee has the ability to collect samples of effluent from a Parshall Flume at the Neosho Crowder WWTP. Therefore, Internal Monitoring Point #IP3 is located in the effluent stream which includes only the Neosho Crowder WWTP effluent at the Neosho Shoal Creek WWTP. Monitoring at this location is necessary so the permittee can collect samples to determine compliance with technology based requirements for the Neosho Crowder WWTP prior to the mixing of the two effluents.

Legal Description: NE ¼, NE ¼, Sec. 13, T25N, R32W, Newton County  
UTM Coordinates: X= 377603, Y= 4083919

**Internal Monitoring Point #IP4 – Influent Monitoring Location for Neosho Shoal Creek WWTP**

Internal Monitoring Point #IP4 is the location where influent monitoring of the Neosho Shoal Creek WWTP shall take place. Influent monitoring at this location is necessary in order to determine the removal efficiency of the Neosho Shoal Creek WWTP prior to the mixing of the two effluents at the Neosho Shoal Creek WWTP.

Legal Description: NE ¼, NE ¼, Sec. 13, T25N, R32W, Newton County  
UTM Coordinates: X= 377666, Y= 4083897

**Internal Monitoring Point #IP5 – Effluent Monitoring Location for Neosho Shoal Creek WWTP prior to Effluents Mixing**

Internal Monitoring Point #IP5 is the location where effluent monitoring of the Neosho Shoal Creek WWTP shall take place prior to the mixing of the two effluents at the Neosho Shoal Creek WWTP. Effluent from the Neosho Crowder WWTP mixes with effluent from the Neosho Shoal Creek WWTP just prior to the ultraviolet disinfection unit at the Neosho Shoal Creek WWTP. Prior to the mixing of the two effluents, the permittee has the ability to collect samples of effluent from a Parshall Flume at the Neosho Shoal Creek WWTP. Therefore, Internal Monitoring Point #IP5 is located in the effluent stream which includes only the Neosho Shoal Creek WWTP. Monitoring at this location is necessary so the permittee can collect samples to determine compliance with technology based requirements for the Neosho Shoal Creek WWTP prior to the mixing of the two effluents.

Legal Description: NE ¼, NE ¼, Sec. 13, T25N, R32W, Newton County  
UTM Coordinates: X= 377612, Y= 4083922

**Permitted Feature #SM1 – Instream (Upstream) Monitoring Location at Neosho Shoal Creek Wastewater Treatment Plant**

Instream monitoring location – See Special Condition #20

Receiving Stream and ID: Shoal Creek (P) (3222) 303(d) List  
First Classified Stream and ID: Shoal Creek (P) (3222) 303(d) List  
USGS Basin & Sub-watershed No.: (11070207-0804)

**Permitted Feature #SM2 – Instream (Downstream) Monitoring Location at Neosho Shoal Creek Wastewater Treatment Plant**

Instream monitoring location – ¼ mile downstream of Outfall #001 to ensure samples are taken outside of the mixing zone.

Receiving Stream and ID: Shoal Creek (P) (3222) 303(d) List  
First Classified Stream and ID: Shoal Creek (P) (3222) 303(d) List  
USGS Basin & Sub-watershed No.: (11070207-0804)

| <b><u>OUTFALL #001:</u></b><br>Main Facility Outfall at Neosho Shoal Creek WWTP                                                                                                                                                                                                                                                                                                  | <b>TABLE A-1.</b><br><b>INTERIM EFFLUENT LIMITATIONS AND MONITORING REQUIREMENTS</b> |                              |                |                 |                         |              |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------|------------------------------|----------------|-----------------|-------------------------|--------------|
| The permittee is authorized to discharge from outfall(s) with serial number(s) as specified in the application for this permit. The interim effluent limitations shall become effective on <b><u>May 1, 2017</u></b> and remain in effect through <b><u>April 30, 2018</u></b> . Such discharges shall be controlled, limited and monitored by the permittee as specified below: |                                                                                      |                              |                |                 |                         |              |

\* Monitoring requirement only.

\*\*\*\* pH is measured in pH units and is not to be averaged.

Note 1 – Effluent limitations and monitoring requirements for *E. coli* are applicable only during the recreational season from April 1 through October 31. The Monthly Average Limit for *E. coli* is expressed as a geometric mean. The Weekly Average for *E. coli* will be expressed as a geometric mean if more than one (1) sample is collected during a calendar week (Sunday through Saturday).

| MONITORING REPORTS SHALL BE SUBMITTED <u>MONTHLY</u> ; THE FIRST REPORT IS DUE <u>JUNE 28, 2017</u> .                                                                                                                                                                                                                                                            |         |                                                                      |                |                 |                         |              |

\* Monitoring requirement only.

\*\* A 24-hour composite sample is composed of 48 aliquots (subsamples) collected at 30 minute intervals by an automatic sampling device.

\*\*\*\*\* pH is measured in pH units and is not to be averaged.

Note 2 –Effluent limits of 126 #/100 mL daily maximum and monitoring only for monthly average for *E. coli* are applicable year round due to losing stream designation. No more than 10% of samples over the course of a calendar year shall exceed the 126 #/100 mL daily maximum.

Note 3 – This permit contains a Total Residual Chlorine (TRC) limit.

- The Water Quality Based Effluent Limit for Total Residual Chlorine was calculated to be 17 µg/L (daily maximum limit) and 8 µg/L (monthly average limit). These limits are below the minimum quantification level (ML) of the most common and practical EPA approved CLTRC methods. The Department has determined the current acceptable ML for total residual chlorine to be 130 µg/L when using the DPD Colorimetric Method #4500 – CL G. from Standard Methods for the Examination of Waters and Wastewater. The permittee will conduct analyses in accordance with this method, or equivalent, and report actual analytical values. The minimum quantification level does not authorize the discharge of chlorine in excess of the effluent limits stated in the permit. Measured values greater than or equal to the minimum quantification level of 130 µg/L will be considered violations of the permit and values less than the minimum quantification level of 130 µg/L will be considered to be in compliance with the permit limitation.
- Disinfection is required year-round.
- Do not chemically de-chlorinate **if it is not needed to meet the limits in your permit.**
- If no chlorine was used in a given sampling period, an actual analysis for TRC is not necessary. Simply report as “0 µg/L” for TRC.

| First                         | January, February, March    | Sample at least once during any month of the quarter | April 28 <sup>th</sup>   |
| Second                        | April, May, June            | Sample at least once during any month of the quarter | July 28 <sup>th</sup>    |
| Third                         | July, August, September     | Sample at least once during any month of the quarter | October 28 <sup>th</sup> |
| Fourth                        | October, November, December | Sample at least once during any month of the quarter | January 28 <sup>th</sup> |

Note 4 – The Water Quality Based Effluent Limit for Cyanide amenable to chlorination was calculated to be 8.2 µg/L (daily maximum limit) and 4.1 µg/L (monthly average limit). These limits are below the minimum quantification level (ML) of the most common and practical EPA approved Cyanide amenable to chlorination methods. The Department has determined the current acceptable ML of Cyanide Amenable to Chlorination (CATC) to be 10 µg/L when using SM 4500-CN<sup>-</sup>G. Cyanides Amenable to Chlorination after Distillation in *Standard Methods for the Examination of Water and Wastewater*, 22<sup>nd</sup>. The permittee will conduct analyses in accordance with this method, or equivalent, and report actual analytical values. Measured values greater than or equal to the minimum quantification level of 10 µg/L will be considered violations of the permit and values less than the minimum quantification level of 10 µg/L will be considered to be in compliance with the permit limitation. The minimum quantification level does not authorize the discharge of cyanide in excess of the effluent limits stated in the permit.

\* Monitoring requirement only.

\*\* A 24-hour composite sample is composed of 48 aliquots (subsamples) collected at 30 minute intervals by an automatic sampling device.

\*\*\*\* pH is measured in pH units and is not to be averaged.

Note 5 – Influent sampling is not required during periods of land application when the facility does not discharge effluent. Influent samples are to be collected at Internal Monitoring Point #IP1 prior to any treatment process in order to determine removal efficiency at the Neosho Crowder WWTP. Percent removal is calculated by the following formula:  $[(\text{Influent at \#IP1} - \text{Effluent at \#IP3}) / \text{Influent at \#IP1}] \times 100\% = \text{Percent Removal}$ . The Monthly Average Minimum Percent removal is to be reported as the average of all daily calculated removal efficiencies. Influent samples are to be collected as a 24-hour composite sample, composed of 48 aliquots (subsamples) collected at 30 minute intervals by an automatic sampling device.

\* Monitoring requirement only.

\*\* A 24-hour composite sample is composed of 48 aliquots (subsamples) collected at 30 minute intervals by an automatic sampling device.

\*\*\*\* pH is measured in pH units and is not to be averaged.

Note 6 – Influent sampling is not required during periods of land application when the facility does not discharge effluent. Influent samples are to be collected at Internal Monitoring Point #IP4 prior to any treatment process in order to determine removal efficiency at the Neosho Shoal Creek WWTP. Percent removal is calculated by the following formula:  $[(\text{Influent at \#IP4} - \text{Effluent at \#IP5}) / \text{Influent at \#IP4}] \times 100\% = \text{Percent Removal}$ . The Monthly Average Minimum Percent removal is to be reported as the average of all daily calculated removal efficiencies. Influent samples are to be collected as a 24-hour composite sample, composed of 48 aliquots (subsamples) collected at 30 minute intervals by an automatic sampling device.

### **C. STANDARD CONDITIONS**

In addition to specified conditions stated herein, this permit is subject to the attached **Parts I, II, & III** standard conditions dated **August 1, 2014, May 1, 2013, and March 1, 2015**, and hereby incorporated as though fully set forth herein.

### **D. SPECIAL CONDITIONS**

1. This permit establishes final ammonia limitations based on Missouri's current Water Quality Standard. On August 22, 2013, the U.S. Environmental Protection Agency (EPA) published a notice in the Federal Register announcing of the final national recommended ambient water quality criteria for protection of aquatic life from the effects of ammonia in freshwater. The EPA's guidance, Final Aquatic Life Ambient Water Quality Criteria for Ammonia – Fresh Water 2013, is not a rule, nor automatically part of a state's water quality standards. States must adopt new ammonia criteria consistent with EPA's published ammonia criteria into their water quality standards that protect the designated uses of the water bodies. The Department of Natural Resources has initiated stakeholder discussions on how to best incorporate these new criteria into the State's rules. A date for when this rule change will occur has not been determined. Also, refer to Section VI of this permit's factsheet for further information including estimated future effluent limits for this facility. It is recommended the permittee view the Department's 2013 EPA criteria Factsheet located at <http://dnr.mo.gov/pubs/pub2481.htm>.
2. This permit may be reopened and modified, or alternatively revoked and reissued, to:
  - (a) Comply with any applicable effluent standard or limitation issued or approved under Sections 301(b)(2)(C) and (D), 304(b)(2), and 307(a) (2) of the Clean Water Act, if the effluent standard or limitation so issued or approved:
    - (1) contains different conditions or is otherwise more stringent than any effluent limitation in the permit; or
    - (2) controls any pollutant not limited in the permit.
  - (b) Incorporate new or modified effluent limitations or other conditions, if the result of a waste load allocation study, toxicity test including acute and chronic Whole Effluent Toxicity (WET) tests, or other information indicates changes are necessary to assure compliance with Missouri's Water Quality Standards.
  - (c) Incorporate new or modified effluent limitations or other conditions if, as the result of a watershed analysis, a Total Maximum Daily Load (TMDL) limitation is developed for the receiving waters which are currently included in Missouri's list of waters of the state not fully achieving the state's water quality standards, also called the 303(d) list.
  - (d) Incorporate the requirement to develop a pretreatment program pursuant to 40 CFR 403.8(a) when the Director of the Water Protection Program determines that a pretreatment program is necessary due to any new introduction of pollutants into the Publically Owned Treatment Works or any substantial change in the volume or character of pollutants being introduced.

The permit as modified or reissued under this paragraph shall also contain any other requirements of the Clean Water Act then applicable.

**D. SPECIAL CONDITIONS (continued)**

3. All outfalls must be clearly marked in the field. This does not include instream monitoring locations.
4. Permittee will cease discharge by connection to a facility with an area-wide management plan per 10 CSR 20-6.010(3)(B) within 90 days of notice of its availability.
5. Report as no-discharge when a discharge does not occur during the report period. For instream samples, report as “no flow” if no stream flow occurs during the report period.
6. Water Quality Standards
  - (a) To the extent required by law, discharges to waters of the state shall not cause a violation of water quality standards rule under 10 CSR 20-7.031, including both specific and general criteria.
  - (b) General Criteria. The following general water quality criteria shall be applicable to all waters of the state at all times including mixing zones. No water contaminant, by itself or in combination with other substances, shall prevent the waters of the state from meeting the following conditions:
    - (1) Waters shall be free from substances in sufficient amounts to cause the formation of putrescent, unsightly or harmful bottom deposits or prevent full maintenance of beneficial uses;
    - (2) Waters shall be free from oil, scum and floating debris in sufficient amounts to be unsightly or prevent full maintenance of beneficial uses;
    - (3) Waters shall be free from substances in sufficient amounts to cause unsightly color or turbidity, offensive odor or prevent full maintenance of beneficial uses;
    - (4) Waters shall be free from substances or conditions in sufficient amounts to result in toxicity to human, animal or aquatic life;
    - (5) There shall be no significant human health hazard from incidental contact with the water;
    - (6) There shall be no acute toxicity to livestock or wildlife watering;
    - (7) Waters shall be free from physical, chemical or hydrologic changes that would impair the natural biological community;
    - (8) Waters shall be free from used tires, car bodies, appliances, demolition debris, used vehicles or equipment and solid waste as defined in Missouri's Solid Waste Law, section 260.200, RSMo, except as the use of such materials is specifically permitted pursuant to section 260.200-260.247.
7. Changes in existing pollutants or the addition of new pollutants to the treatment facility

The permittee must provide adequate notice to the Director of the following:

  - (a) Any new introduction of pollutants into the POTW from an indirect discharger which would be subject to section 301 or 306 of CWA if it were directly discharging those pollutants; and
  - (b) Any substantial change in the volume or character of pollutants being introduced into that POTW by a source introducing pollutants into the POTW at the time of issuance of the permit.
  - (c) For purposes of this paragraph, adequate notice shall include information on:
    - (1) the quality and quantity of effluent introduced into the POTW, and
    - (2) any anticipated impact of the change on the quantity or quality of effluent to be discharged from the POTW.
8. Reporting of Non-Detects:
  - (a) An analysis conducted by the permittee or their contracted laboratory shall be conducted in such a way that the precision and accuracy of the analyzed result can be enumerated.
  - (b) The permittee shall not report a sample result as “Non-Detect” without also reporting the detection limit of the test. Reporting as “Non Detect” without also including the detection limit will be considered failure to report, which is a violation of this permit.
  - (c) The permittee shall provide the “Non-Detect” sample result using the less than sign and the minimum detection limit (e.g. <10).
  - (d) Where the permit contains a Minimum Level (ML) and the permittee is granted authority in the permit to report zero in lieu of the < ML for a specified parameter (conventional, priority pollutants, metals, etc.), then zero (0) is to be reported for that parameter.
  - (e) See Standard Conditions Part I, Section A, #4 regarding proper detection limits used for sample analysis.
  - (f) When calculating monthly averages, one-half of the method detection limit (MDL) should be used instead of a zero. Where all data are below the MDL, the “<MDL” shall be reported as indicated in item (c).
9. It is a violation of the Missouri Clean Water Law to fail to pay fees associated with this permit (644.055 RSMo).

**D. SPECIAL CONDITIONS (continued)**

10. The permittee shall comply with any applicable requirements listed in 10 CSR 20-9, unless the facility has received written notification that the Department has approved a modification to the requirements. The monitoring frequencies contained in this permit shall not be construed by the permittee as a modification of the monitoring frequencies listed in 10 CSR 20-9. If a modification of the monitoring frequencies listed in 10 CSR 20-9 is needed, the permittee shall submit a written request to the Department for review and, if deemed necessary, approval.
11. The permittee shall develop and implement a program for maintenance and repair of the collection system. The recommended guidance is the US EPA's Guide For Evaluating Capacity, Management, Operation, And Maintenance (CMOM) Programs At Sanitary Sewer Collection Systems (Document number EPA 305-B-05-002) or the Departments' CMOM Model located at <http://dnr.mo.gov/env/wpp/permits/docs/cmom-template.doc>. For additional information regarding the Departments' CMOM Model, see the CMOM Plan Model Guidance document at <http://dnr.mo.gov/pubs/pub2574.htm>.  
  
The permittee shall also submit a report to the Southwest Regional Office annually, by January 28<sup>th</sup>, for the previous calendar year. The report shall contain the following information:
  - (a) A summary of the efforts to locate and eliminate sources of excessive infiltration and inflow into the collection system serving the facility for the previous year.
  - (b) A summary of the general maintenance and repairs to the collection system serving the facility for the previous year.
  - (c) A summary of any planned maintenance and repairs to the collection system serving the facility for the upcoming calendar year. This list shall include locations (GPS, 911 address, manhole number, etc.) and actions to be taken.
12. Bypasses are not authorized at this facility unless they meet the criteria in 40 CFR 122.41(m). If a bypass occurs, the permittee shall report in accordance to 40 CFR 122.41(m)(3), and with Standard Condition Part I, Section B, subsection 2.b. Bypasses are to be reported to the Southwest Regional Office or by using the online Sanitary Sewer Overflow/Facility Bypass Application, located at: <http://dnr.mo.gov/modnrcag/> during normal business hours or the Environmental Emergency Response hotline at 573-634-2436 outside of normal business hours. Blending, which is the practice of combining a partially-treated wastewater process stream with a fully-treated wastewater process stream prior to discharge, is not considered a form of bypass. If the permittee wishes to utilize blending, the permittee shall file an application to modify this permit to facilitate the inclusion of appropriate monitoring conditions.
13. The facility must be sufficiently secured to restrict entry by children, livestock and unauthorized persons as well as to protect the facility from vandalism.
14. At least one gate must be provided to access the wastewater treatment facility and provide for maintenance and mowing. The gate shall remain closed except when temporarily opened by; the permittee to access the facility, perform operational monitoring, sampling, maintenance, mowing, or for inspections by the Department. The gate shall be closed and locked when the facility is not staffed.
15. At least one (1) warning sign shall be placed on each side of the facility enclosure in such positions as to be clearly visible from all directions of approach. There shall also be one (1) sign placed for every five hundred feet (500') (150 m) of the perimeter fence. A sign shall also be placed on each gate. Minimum wording shall be SEWAGE TREATMENT FACILITY—KEEP OUT. Signs shall be made of durable materials with characters at least two inches (2") high and shall be securely fastened to the fence, equipment or other suitable locations.
16. An Operation and Maintenance (O & M) manual shall be maintained by the permittee and made available to the operator. The O & M manual shall include key operating procedures and a brief summary of the operation of the facility.
17. An all-weather access road shall be provided to the treatment facility.
18. The discharge from the wastewater treatment facility shall be conveyed to the receiving stream via a closed pipe or a paved or rip-rapped open channel. Sheet or meandering drainage is not acceptable. The outfall sewer shall be protected against the effects of floodwater, ice or other hazards as to reasonably insure its structural stability and freedom from stoppage. The outfall shall be maintained so that a sample of the effluent can be obtained at a point after the final treatment process and before the discharge mixes with the receiving waters.
19. Land application of biosolids shall be conducted in accordance with Standard Conditions III and a Department approved biosolids management plan. Land application of biosolids during frozen, snow covered, or saturated soil conditions in accordance with the additional requirements specified in WQ426 shall occur only with prior approval from the Department.

**D. SPECIAL CONDITIONS (continued)**

20. Receiving Water Monitoring Conditions
- (a) Downstream receiving water samples should be taken at the location(s) specified on Page 2 of this permit. In the event that a safe, accessible location is not present at the location(s) listed, a suitable location can be negotiated with the Department. Samples should be taken at least four feet from the bank or from the middle of the stream (whichever is less) and 6-inches below the surface. The upstream receiving water sample should be collected at a point upstream from any influence of the effluent, where the water is visibly flowing down stream.
  - (b) When conducting in-stream monitoring, the permittee shall record observations that include: the time of day, weather conditions, unusual stream characteristics (e.g., septic conditions, algae growth, etc.), the stream segment (e.g., riffle, pool or run) from where the sample was collected. These observations shall be submitted with the sample results.
  - (c) Samples shall not be collected from areas with especially turbulent flow, still water or from the stream bank, unless these conditions are representative of the stream reach or no other areas are available for sample collection. Sampling should not be made when significant precipitation has occurred recently. The sampling event should be terminated and rescheduled if any of the following conditions occur:
    - If turbidity in the stream increases notably; or
    - If rainfall over the past two weeks exceeds 2.5 inches or exceeds 1 inch in the last 24 hours
  - (d) Always use the correct sampling technique and handling procedure specified for the parameter of interest. Please refer to the latest edition of Standard Methods for the Examination of Water and Wastewater for further discussion of proper sampling techniques. All analyses must be conducted in accordance with an approved EPA method. Meters shall be calibrated immediately (within 1 hour) prior to the sampling event.
  - (e) Please contact the Department if you need additional instructions or assistance.
21. The permittee shall implement and enforce its approved pretreatment program in accordance with the requirements of 10 CSR 20-6.100. The approved pretreatment program is hereby incorporated by reference.

The permittee shall submit to the Department on or before March 31<sup>st</sup> of each year a report briefly describing its pretreatment activities during the previous calendar year. At a minimum, the report shall include the following:

- (a) An updated list of the Permittee's Industrial Users, including their names and addresses, or a list of deletions and additions keyed to a previously submitted list. The Permittee shall provide a brief explanation of each deletion. This list shall identify which Industrial Users are subject to categorical pretreatment Standards and specify which Standards are applicable to each Industrial User. The list shall indicate which Industrial Users are subject to local standards that are more stringent than the categorical Pretreatment Standards. The Permittee shall also list the Industrial Users that are subject only to local Requirements;
- (b) A summary of the status of Industrial User compliance over the reporting period;
- (c) A summary of compliance and enforcement activities (including inspections) conducted by the Permittee during the reporting period; and
- (d) Any other relevant information requested by the Department.

Pursuant to 40 CFR 122.44(j)(2)(ii), the permittee shall submit to the Department a written technical evaluation of the need to revise local limits under 40 CFR 403.5(c)(1) along with the application for renewal of this permit.

22. Stormwater Pollution Prevention Plan (SWPPP): A SWPPP must be developed and implemented within 180 days of the effective date of the permit. Through implementation of the SWPPP, the permittee shall minimize the release of pollutants in stormwater from the facility to the waters of the state. The SWPPP shall be developed in consultation with the concepts and methods described in the following document: Developing Your Stormwater Pollution Prevention Plan, A Guide for Industrial Operators, (Document number EPA 833-B-09-002) published by the United States Environmental Protection Agency (USEPA) in February 2009.
- (a) The SWPPP must identify any stormwater outfall from the facility and Best Management Practices (BMPs) used to prevent or reduce the discharge of contaminants in stormwater. The stormwater outfalls shall either be marked in the field or clearly marked on a map and maintained with the SWPPP.
  - (b) The SWPPP must include a schedule and procedures for a once per month routine site inspection.
    - (1) The monthly routine inspection shall be documented in a brief written report, which shall include:
      - i. The person(s) conducting the inspection.
      - ii. The inspection date and time.
      - iii. Weather information for the day of the inspection.
      - iv. Precipitation information for the entire period since the last inspection.
      - v. Description of the discharges observed, including visual quality of the discharges (sheen, turbid, etc.).
      - vi. Condition of BMPs

**D. SPECIAL CONDITIONS (continued)**

- vii. If BMPs were replaced or repaired.
  - viii. Observations and evaluations of BMP effectiveness.
  - ii. Any deficiency observed during the routine inspection must be corrected within seven (7) days and the actions taken to correct the deficiencies shall be included with the written report.
  - iii. The routine inspection reports must be kept onsite with the SWPPP and maintained for a period of five (5) years.
  - iv. The routine inspection reports shall be made available to Department personnel upon request.
  - (c) The SWPPP must include a schedule and procedures for a once per year comprehensive site inspection.
    - (1) The annual comprehensive inspection shall be documented in a written report, which shall include:
      - i. The person(s) conducting the inspection.
      - ii. The inspection date and time.
      - iii. Findings from the areas of your facility that were examined;
      - iv. All observations relating to the implementation of your control measures including:
        - 1. Previously unidentified discharges from the site,
        - 2. Previously unidentified pollutants in existing discharges,
        - 3. Evidence of, or the potential for, pollutants entering the drainage system;
        - 4. Evidence of pollutants discharging to receiving waters at all facility outfall(s), and the condition of and around the outfall, and
        - 5. Additional control measures needed to address any conditions requiring corrective action identified during the inspection.
      - v. Any required revisions to the SWPPP resulting from the inspection;
      - vi. Any incidence of noncompliance observed or a certification stating that the facility is in compliance with Special Condition D.22.
    - (2) Any deficiency observed during the comprehensive inspection must be corrected within seven (7) days and the actions taken to correct the deficiencies shall be included with the written report.
    - (3) The comprehensive inspection reports must be kept onsite with the SWPPP and maintained for a period of five (5) years.
    - (4) The comprehensive inspection reports shall be made available to Department personnel upon request.
  - (d) The SWPPP must be kept on-site and should not be sent to the Department unless specifically requested.
  - (e) The SWPPP must be reviewed and updated at a minimum once per permit cycle, as site conditions or control measures change.
23. The permittee shall select, install, use, operate, and maintain the Best Management Practices prescribed in the SWPPP.
- (b) Permittee shall adhere to the following minimum Best Management Practices (BMPs):
    - (1) Minimize the exposure of industrial material storage areas, loading and unloading areas, dumpsters and other disposal areas, maintenance activities, and fueling operations to rain, snow, snowmelt, and runoff, by locating industrial materials and activities inside or protecting them with storm resistant coverings, if warranted and practicable.
    - (2) Provide good housekeeping practices on the site to prevent potential pollution sources from coming into contact with stormwater and provide collection facilities and arrange for proper disposal of waste products, including sludge.
    - (3) Implement a maintenance program to ensure that the structural control measures and industrial equipment is kept in good operating condition and to prevent or minimize leaks and other releases of pollutants.
    - (4) Prevent or minimize the spillage or leaks of fluids, oil, grease, fuel, etc. from equipment and vehicle maintenance, equipment and vehicle cleaning, or activities.
    - (5) Provide sediment and erosion control sufficient to prevent or control sediment loss off of the property. This could include the use of straw bales, silt fences, or sediment basins, if needed.
    - (6) Provide stormwater runoff controls to divert, infiltrate, reuse, contain, or otherwise minimize pollutants in the stormwater discharge.
    - (7) Enclose or cover storage piles of salt or piles containing salt, used for deicing or other commercial or industrial purposes.
    - (8) Provide training to all employees who; work in areas where industrial materials or activities are exposed to stormwater, are responsible for stormwater inspections, are members of the Pollution Prevention Team. Training must cover the specific control measures and monitoring, inspection, planning, reporting and documentation requirements of this permit. Training is recommended annually for any applicable staff and whenever a new employee is hired who meets the description above.
    - (9) Eliminate and prevent unauthorized non-stormwater discharges at the facility.
    - (10) Minimize generation of dust and off-site tracking of raw, final, or waste materials by implementing appropriate control measures.

**D. SPECIAL CONDITIONS (continued)**

24. Acute Whole Effluent Toxicity (WET) tests shall be conducted as follows:
- (a) Freshwater Species and Test Methods: Species and short-term test methods for estimating the acute toxicity of NPDES effluents are found in the most recent edition of *Methods for Measuring the Acute Toxicity of Effluents and Receiving Waters to Freshwater and Marine Organisms* (EPA/821/R-02/012; Table IA, 40 CFR Part 136). The permittee shall concurrently conduct 48-hour, static, non-renewal toxicity tests with the following species:
    - o The fathead minnow, *Pimephales promelas* (Acute Toxicity EPA Test Method 2000.0).
    - o The daphnid, *Ceriodaphnia dubia* (Acute Toxicity EPA Test Method 2002.0).
  - (b) Chemical and physical analysis of the upstream control sample and effluent sample shall occur immediately upon being received by the laboratory, prior to any manipulation of the effluent sample beyond preservation methods consistent with federal guidelines for WET testing that are required to stabilize the sample during shipping. Where upstream receiving water is not available or known to be toxic, other approved control water may be used.
  - (c) Test conditions must meet all test acceptability criteria required by the EPA Method used in the analysis.
  - (d) The Allowable Effluent Concentration (AEC) for this facility is 100% with the dilution series being: 100%, 50%, 25%, 12.5%, and 6.25%.
  - (e) All chemical and physical analysis of the effluent sample performed in conjunction with the WET test shall be performed at the 100% effluent concentration.
  - (f) The facility must submit a full laboratory report for all toxicity testing. The report must include a quantification of acute toxic units ( $TU_a = 100/LC_{50}$ ) reported according to the test methods manual chapter on report preparation and test review. The Lethal Concentration 50 Percent ( $LC_{50}$ ) is the effluent concentration that would cause death in 50 percent of the test organisms at a specific time.
25. Chronic Whole Effluent Toxicity (WET) tests shall be conducted as follows:
- (a) Freshwater Species and Test Methods: Species and short-term test methods for estimating the chronic toxicity of NPDES effluents are found in the most recent edition of *Short-term Methods for Estimating the Chronic Toxicity of Effluents and Receiving Waters to Freshwater Organisms* (EPA/821/R-02/013; Table IA, 40 CFR Part 136). The permittee shall concurrently conduct 7-day, static, renewal toxicity tests with the following species:
    - o The fathead minnow, *Pimephales promelas* (Survival and Growth Test Method 1000.0).
    - o The daphnid, *Ceriodaphnia dubia* (Survival and Reproduction Test Method 1002.0).
  - (b) Chemical and physical analysis of the upstream control sample and effluent sample shall occur immediately upon being received by the laboratory, prior to any manipulation of the effluent sample beyond preservation methods consistent with federal guidelines for WET testing that are required to stabilize the sample during shipping. Where upstream receiving water is not available or known to be toxic, other approved control water may be used.
  - (c) Test conditions must meet all test acceptability criteria required by the EPA Method used in the analysis.
  - (d) The Allowable Effluent Concentration (AEC) is 100%, the dilution series is: 100%, 50%, 25%, 12.5%, and 6.25%.
  - (e) All chemical and physical analysis of the effluent sample performed in conjunction with the WET test shall be performed at the 100% effluent concentration.
  - (f) The facility must submit a full laboratory report for all toxicity testing. The report must include a quantification of chronic toxic units ( $TU_c = 100/IC_{25}$ ) reported according to the *Methods for Measuring the Chronic Toxicity of Effluents and Receiving Waters to Freshwater and Marine Organisms* chapter on report preparation and test review. The 25 percent Inhibition Effect Concentration ( $IC_{25}$ ) is the toxic or effluent concentration that would cause 25 percent reduction in mean young per female or in growth for the test populations.
26. **Electronic Discharge Monitoring Report (eDMR) Submission System.**
- The permittee shall submit an eDMR Permit Holder and Certifier Registration form **within 90 days of the effective date** of this permit. Per 40 CFR Part 127 National Pollutant Discharge Elimination System (NPDES) Electronic Reporting Rule, reporting of effluent limits and monitoring shall be submitted by the permittee via an electronic system to ensure a timely, complete, accurate, and nationally-consistent set of data. Visit <http://dnr.mo.gov/pubs/pub2474.pdf> to access the Facility Participation Package which contains the eDMR Permit Holder and Certifier Registration form.

Once the permittee is activated in the eDMR system:

- (a) Discharge Monitoring Reporting Requirements. The permittee must electronically submit compliance monitoring data via the eDMR system. In regards to Standard Conditions Part I, Section B, #7, the eDMR system is currently the only Department approved reporting method for this permit.
- (b) Programmatic Reporting Requirements. The following reports (if required by this permit) must be electronically submitted as an attachment to the eDMR system until such a time when the current or a new system is available to allow direct input of the data:
  - (1) Collection System Maintenance Annual Reports;
  - (2) Schedule of Compliance Progress Reports;

#### **D. SPECIAL CONDITIONS (continued)**

- (3) Sludge/Biosolids Annual Reports;
    - i. In addition to the annual Sludge/Biosolids report submitted to the department, the permittee must submit Sludge/Biosolids Annual Reports electronically using EPA's NPDES Electronic Reporting Tool ("NeT")
  - (4) Pretreatment Program Reports;
  - (5) Any additional report required by the permit excluding bypass reporting.
- After such a system has been made available by the department, required data shall be directly input into the system by the next report due date.
- (c) Other actions. The following shall be submitted electronically after such a system has been made available by the department:
    - (1) Notices of Termination (NOTs);
    - (2) Bypass reporting. See Special Condition #12 for 24-hr. bypass reporting requirements.
  - (d) Electronic Submissions. To access the eDMR system, use the following link in your web browser: <https://edmr.dnr.mo.gov/edmr/E2/Shared/Pages/Main/Login.aspx>.
  - (e) Waivers from Electronic Reporting. The permittee must electronically submit compliance monitoring data and reports unless a waiver is granted by the department in compliance with 40 CFR Part 127. The permittee may obtain an electronic reporting waiver by first submitting an eDMR Waiver Request Form: <http://dnr.mo.gov/forms/780-2692-f.pdf>. The department will either approve or deny this electronic reporting waiver request within 120 calendar days. Only permittees with an approved waiver request may submit monitoring data and reports on paper to the Department for the period that the approved electronic reporting waiver is effective.

#### **E. SCHEDULE OF COMPLIANCE**

##### **Outfall #001:**

Ammonia. The facility shall attain compliance with final effluent limitations as soon as reasonably achievable or no later than one (1) year of the effective date of this permit. The existing oxidation ditch facility employs technology capable of meeting the proposed final effluent limitations for ammonia, but discharge monitoring reports indicate the facility has not always been in compliance with the proposed limitations. Therefore this permit includes a one (1) year schedule of compliance to make sufficient operational changes so that consistent compliance with final effluent limitations for ammonia is attained at Outfall #001.

Phenol, Total Recoverable Cadmium, Total Recoverable Iron, & Total Recoverable Selenium. The facility shall attain compliance with final effluent limitations as soon as reasonably achievable or no later than one (1) year of the effective date of this permit. As a result of a Reasonable Potential Analysis (RPA), it has been determined that the facility has a reasonable potential to exceed water quality standards for the above listed parameters. Due to the fact that these are new and more stringent effluent limitations, the facility has requested a schedule of compliance to meet final effluent limitations. Therefore, this permit includes a one (1) year schedule of compliance to make sufficient operational changes so that consistent compliance with final effluent limitations for ammonia is attained at Outfall #001.

##### **Outfall #002:**

Total Phosphorus. The facility shall attain compliance with final effluent limitations as soon as reasonably achievable or no later than five (5) years of the effective date of this permit.

1. The permittee shall submit interim progress reports detailing progress made in attaining compliance with the final effluent limits every 12 months from effective date.
2. Within 5 years of the effective date of this permit, the permittee shall attain compliance with the final effluent limits.

Please submit progress reports to the Missouri Department of Natural Resources via the Electronic Discharge Monitoring Report (eDMR) Submission System.

##### **Outfall #002 & Internal Monitoring Point #IP2:**

Total Recoverable Chromium (III), Dissolved Chromium (VI), Total Recoverable Copper, Total Recoverable Lead, Total Recoverable Mercury, Total Recoverable Nickel, & Total Recoverable Zinc. The facility shall attain compliance with final effluent limitations as soon as reasonably achievable or no later than one (1) year of the effective date of this permit. As a result of technical mistakes noticed by the permit writer, this permit includes new and more stringent effluent limitations than those of the previous permit for the above listed parameters. Due to the fact that these are new and more stringent effluent limitations and the limited amount of effluent data related to the above listed parameters, the facility has requested a schedule of compliance to meet final effluent limitations. Therefore, this permit includes a one (1) year schedule of compliance to make sufficient operational changes so that consistent compliance with final effluent limitations for ammonia is attained at Outfall #001.

**MISSOURI DEPARTMENT OF NATURAL RESOURCES  
FACT SHEET  
FOR THE PURPOSE OF RENEWAL  
OF  
MO-0104906  
NEOSHO WASTEWATER TREATMENT PLANT**

The Federal Water Pollution Control Act ("Clean Water Act" Section 402 Public Law 92-500 as amended) established the National Pollution Discharge Elimination System (NPDES) permit program. This program regulates the discharge of pollutants from point sources into the waters of the United States, and the release of stormwater from certain point sources. All such discharges are unlawful without a permit (Section 301 of the "Clean Water Act"). After a permit is obtained, a discharge not in compliance with all permit terms and conditions is unlawful. Missouri State Operating Permits (MSOPs) are issued by the Director of the Missouri Department of Natural Resources (Department) under an approved program, operating in accordance with federal and state laws (Federal "Clean Water Act" and "Missouri Clean Water Law" Section 644 as amended). MSOPs are issued for a period of five (5) years unless otherwise specified.

As per [40 CFR Part 124.8(a)] and [10 CSR 20-6.020(1)2.] a Factsheet shall be prepared to give pertinent information regarding the applicable regulations, rationale for the development of effluent limitations and conditions, and the public participation process for the Missouri State Operating Permit (operating permit) listed below.

A Factsheet is not an enforceable part of an operating permit.

This Factsheet is for a Major.

**Part I – Facility Information**

Facility Type: POTW - SIC #4952

Have any changes occurred at this facility or in the receiving water body that effects effluent limit derivation?

☒ - No.

Application Date: 07/18/16

Expiration Date: 12/11/16

**PERMITTED FEATURE(S) TABLE:**

| PERMITTED FEATURE                 | DESIGN FLOW (CFS)                                                                                                                                                                                | TREATMENT LEVEL         | EFFLUENT TYPE |
|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|---------------|
| Outfall #001                      | 4.65                                                                                                                                                                                             | Secondary               | Domestic      |
| Outfall #002                      | 4.65                                                                                                                                                                                             | Equivalent to Secondary | Domestic      |
| Outfall #003                      | <i>Discharge point to the Golf Course Irrigation Storage Ponds. No effluent limitations as effluent quality is monitored at Internal Monitoring Point #IP2.</i>                                  |                         |               |
| Internal Monitoring Point #IP1    | <i>Internal Monitoring Point – Location influent samples from Neosho Crowder WWTP are collected.</i>                                                                                             |                         |               |
| Internal Monitoring Point #IP2    | <i>Internal Monitoring Point – Location following full treatment from Neosho Crowder WWTP where monitoring of effluent sent to the Golf Course Irrigation Storage Ponds occurs.</i>              |                         |               |
| Internal Monitoring Point #IP3    | <i>Internal Monitoring Point – Location following full treatment from Neosho Crowder WWTP where monitoring of effluent sent to the Neosho Shoal Creek WWTP occurs prior to effluents mixing.</i> |                         |               |
| Internal Monitoring Point #IP4    | <i>Internal Monitoring Point – Location influent samples from Neosho Shoal Creek WWTP are collected.</i>                                                                                         |                         |               |
| Internal Monitoring Point #IP5    | <i>Internal Monitoring Point – Location following full treatment from Neosho Shoal Creek WWTP where monitoring of effluent occurs prior to effluents mixing.</i>                                 |                         |               |

### **Facility Description:**

This permit includes two wastewater treatment facilities which serve the City of Neosho. These facilities were previously permitted separately – Neosho Crowder WWTP (MO-0039926) and Neosho Shoal Creek WWTP (MO-0104906). During normal operations at the Neosho Crowder WWTP, effluent is sent to the Neosho Shoal Creek WWTP, where effluent from the two plants mix together prior to the ultraviolet disinfection unit at the Neosho Shoal Creek WWTP. Therefore, it has been determined by the permit writer that combining the two permits into one permit is appropriate.

#### **Outfall #001 – Main Facility Outfall at Neosho Shoal Creek WWTP**

Flow equalization basin / bar screen / 2 oxidation ditches / 2 final clarifiers / ultraviolet disinfection / aerobic sludge digester / 2 aerated sludge holding basins / sludge is land applied.

Design population equivalent is 30,000.

Design flow is 3.0 MGD.

Actual flow is 1.7 MGD.

Design sludge production is 630 dry tons/year.

#### **Outfall #002 – Discharge at Neosho Crowder WWTP (previously permitted as Outfall #001 in MO-0039926)**

Discharges at Outfall #002 occur only during high flow events. Typically flow from the Neosho Crowder WWTP is sent to the Neosho Shoal Creek WWTP.

Flow equalization basin / bar screen / 2 pre-aeration basins / 2 primary clarifiers / 3 trickling filters / recirculation basin / 3 secondary clarifiers / chlorine disinfection / chlorine contact basin / dechlorination / 2 primary aerobic sludge digesters / sludge drying bed / sludge is land applied.

Design population equivalent is 29,000.

Design flow is 3.0 MGD.

Actual flow is 0.92 MGD.

Design sludge production is 812 dry tons/year.

#### **Outfall #003 - Discharge Point to the Golf Course Irrigation Storage Ponds**

Outfall #003 has been identified in the permit in order to document the location at which effluent from the Neosho Crowder WWTP is discharged to the golf course irrigation storage ponds.

#### **Internal Monitoring Points #IP1 - #IP5**

It has been determined by the permit writer that the previous permit for Neosho Crowder WWTP (MO-0039926) be combined with the permit for Neosho Shoal Creek WWTP. In doing this, Internal Monitoring Points were created so that compliance with various requirements could be demonstrated.

- Internal Monitoring Point #IP1: location where Neosho Crowder WWTP influent monitoring occurs for the purposes of determining removal efficiency for the Neosho Crowder WWTP.
- Internal Monitoring Point #IP2: location where Neosho Crowder WWTP effluent monitoring occurs when the facility sends effluent to the golf course irrigation storage ponds.
- Internal Monitoring Point #IP3: location where Neosho Crowder WWTP effluent monitoring occurs when the facility sends effluent to the Neosho Shoal Creek WWTP. Internal Monitoring Point #IP3 is located at the Neosho Shoal Creek WWTP prior to the mixing of effluents from both plants before the ultraviolet disinfection unit at the Neosho Shoal Creek WWTP.
- Internal Monitoring Point #IP4: location where Neosho Shoal Creek WWTP influent monitoring occurs for the purposes of determining removal efficiency for the Neosho Shoal Creek WWTP.
- Internal Monitoring Point #IP5: location where Neosho Shoal Creek WWTP effluent monitoring occurs prior to the mixing of effluents from both plants.

#### **Instream Monitoring Locations #SM1 & #SM2**

- #SM1: monitoring location in Shoal Creek (P) (3222) upstream of Outfall #001 at the Neosho Shoal Creek WWTP.
- #SM2: monitoring location in Shoal Creek (P) (3222) approximately ¼ mile downstream of Outfall #001 at the Neosho Shoal Creek WWTP to ensure samples are taken outside of the mixing zone.

#### **Previous Outfalls / Permitted Features from Neosho Crowder WWTP (previously permitted under MO-0039926)**

The previous permit for the Neosho Crowder WWTP included permitted features which have not been included in this permit. The previous permit required monitoring of fully treated effluent that is pumped from Neosho Crowder WWTP to the golf course irrigation storage ponds (previously identified as Outfall #002 in MO-0039926) for the purposes of land application of water from the ponds. The permit writer has determined that the land application of water from the golf course irrigation storage ponds does not need to be monitored in this permit, as the effluent sent to the golf course irrigation storage ponds is fully treated (including disinfection). Additionally, any sample that would be collected from the storage ponds would not be representative of the Neosho Crowder WWTP effluent quality as the sample would not be exclusively made up of Neosho Crowder WWTP effluent.

**Facility Description (continued):**

**Previous Outfalls / Permitted Features from Neosho Crowder WWTP (previously permitted under MO-0039926) (continued)**

The previous permit for the Neosho Crowder WWTP also required monitoring of water from the golf course irrigation storage ponds in the event of an overflow from the storage ponds (previously identified as Outfall #003 in MO-0039926). The permit writer has determined that water discharged during an overflow from the golf course irrigation storage ponds does not need to be monitored in this permit, as an overflow these ponds is not exclusively water sent to the storage ponds by the Neosho Crowder WWTP. Therefore, any overflow samples collected from the storage ponds would not be representative of the Neosho Crowder WWTP effluent quality as the sample would not be exclusively made up of Neosho Crowder WWTP effluent. Additionally, the permit writer has included Internal Monitoring Point #IP2 so that monitoring of the Neosho Crowder WWTP effluent can occur to demonstrate compliance with water quality standards before effluent enters the golf course irrigation storage ponds. This will ensure that if the ponds overflow, data relating to the Neosho Crowder WWTP effluent will be available. This permit also identifies the location where Neosho Crowder WWTP effluent enters the golf course irrigation storage ponds as Outfall #003.

The previous permit for the Neosho Crowder WWTP also required monitoring of fully treated effluent in the chlorine contact basin for the purposes of removal efficiency (previously identified as Outfall #004 in MO-0039926). The permit writer has included effluent monitoring at Outfall #002, Internal Monitoring Point #IP2, and Internal Monitoring Point #IP3 in order to monitor the Neosho Crowder WWTP effluent during different operational circumstances. To determine removal efficiency for the Neosho Crowder WWTP, the facility should collect a sample of influent and effluent samples at the same time, with influent samples being collected at Internal Monitoring Point #IP1 and effluent samples being collected at one of the locations specified in this permit depending on where effluent is being sent at the time of sample collection.

**Facility Performance History:**

The Neosho Shoal Creek WWTP was last inspected on April 18-19, 2012. The inspection showed the following unsatisfactory features; review of Discharge Monitoring Reports (DMR) showed the facility had not always met effluent limitations of the permit, laboratory procedures did not conform to Standards Conditions Part I, review of the 2011 Form S for biosolids disposal showed the form had not been sufficiently completed, failure to record the volume of screenings, operation and maintenance failures, and showed operational tests were not being performed at the proper frequency. The inspection also mentioned maintaining all information on samples collected or analyzed.

The Neosho Crowder WWTP was last inspected on March 26, 2008. The inspection showed the following unsatisfactory features; no all Sanitary Sewer Overflows (SSOs) have been reported, failure to maintain all information for sampling and analysis conducted, failure to have a quality assurance program for pH, it was unknown at the time of the inspection if weights were ASTM Class I certified, failure to have a certified thermometer, laboratory chemicals were outdated, one clarifier was out of service at the time of the inspection, and the flow meter is not certified annually by a factory authorized representative.

**Permit Comments:**

Special conditions were updated to include the addition of reporting of Non-detects, addition of instream monitoring requirements, addition of Stormwater Pollution Prevention Plan, and addition of requirements to submit to the department via the Electronic Discharge Monitoring Report (eDMR) Submission System. Other special conditions which have changed from the previous permit include inflow and infiltration reporting requirements, bypass reporting requirements, and pretreatment requirements.

The design flow of each facility is 3.0 MGD individually, as reflected in the permit. However, the ultraviolet disinfection unit located at the Neosho Shoal Creek WWTP is designed to treat 6.0 MGD in order to disinfect effluent from both WWTPs prior to the discharge from Outfall #001. Therefore, design flows of 6.0 MGD for Outfall #001 and 3.0 MGD for Outfall #002 were used in effluent limitation derivations.

**Outfall #001 Comments:**

Changes at this location include the addition of monitoring requirements for total nitrogen, total phosphorus, and requirements to conduct a Chronic Whole Effluent Toxicity (WET). This permit also includes the addition of a schedule of compliance to meet final effluent limitations at Outfall #001 for the following parameters; total ammonia nitrogen, phenol, total recoverable cadmium, total recoverable iron, and total recoverable selenium. Other changes in effluent limitations include pH, total recoverable chromium (III), and dissolved chromium (VI). Please see Part VII of the Fact Sheet for further information regarding the addition and removal of effluent parameters. Sampling and reporting frequency was changed from once/month to once/quarter for total recoverable cadmium, total recoverable chromium (III), dissolved chromium (VI), and total recoverable selenium and from once/week to twice/month for ammonia. The reduction in sampling for all of the above listed parameters is due to the consistency of the data submitted for each parameter. This determination will be reevaluated during the next renewal. Weekly sampling is required for *E. coli*, per 10 CSR 20-7.015(9)(D)6.A.

**Outfall #002 Comments (previously identified as Outfall #001 in MO-0039926 – which has been combined with this permit):**

During normal conditions, Outfall #002 typically has no discharge. However, discharges may occur from Outfall #002 during high flow events when the effluent pumps cannot send all the Neosho Crowder WWTP effluent to the Neosho Shoal Creek WWTP. Changes at this location include the addition of monitoring requirements for total nitrogen, total recoverable iron, and total recoverable selenium and the removal of requirements to conduct Acute Whole Effluent Toxicity (WET). Other changes in effluent limitations include ammonia, *E. coli*, nitrates, pH, 1,2-dichloroethane, 1,1,2-trichloroethane, cyanide, phenol, sulfates, and total dissolved boron. See Part VII of the Fact Sheet for further information regarding the addition and removal of effluent parameters. Sampling and reporting frequency was changed from once/week to twice/month for ammonia and nitrates, from once/week to once/quarter for total hardness, oil & grease, 1,2-dichloroethane, 1,1,1-trichloroethane, 1,1,2-trichloroethane, cyanide amenable to chlorination, phenol, sulfates, total dissolved boron, total recoverable cadmium, total recoverable chromium (III), dissolved chromium (VI), total recoverable copper, total recoverable lead, total recoverable mercury, total recoverable nickel, and total recoverable zinc. These changes in sampling and reporting frequency are due to the infrequency of the discharge at these locations along with the determination made by the permit writer that the effluent concentrations for the above listed parameters consistency of the discharges. This determination will be reevaluated upon renewal. Weekly sampling is required for *E. coli*, per 10 CSR 20-7.015(9)(D)6.A.

This permit also includes the addition of a schedule of compliance to meet final effluent limitations at Outfall #002 for total phosphorus as a result of a TMDL as demonstrated in Tables A-5 and A-6 of the permit.

This facility adds chemicals to dechlorinate the effluent prior to discharge at Outfall #002. Dechlorination chemicals have the potential to reduce dissolved oxygen concentrations in the discharge, resulting in an anoxic discharge, unless carefully controlled. However, Outfall #002 rarely discharges and when a discharge does occur, it is due to high flow events caused by Inflow and Infiltration (I&I). Due to the receiving stream condition and the effluent condition at the time of discharges from Outfall #002, it has been determined by the permit writer that there is no reasonable potential to violate water quality standards for dissolved oxygen and therefore no monitoring requirements have been included in this permit.

**Internal Monitoring Point #IP2 Comments:**

The permit writer has created Internal Monitoring Point #IP2 in order to monitoring effluent that is sent to the golf course irrigation storage ponds, as the last storage pond has the ability to overflow. As a result, the permit writer has determined that these interconnected ponds act as a receiving stream as opposed to a permanent storage structure. In the previous permit, monitoring of the storage pond overflow was required, in turn, creating a point of compliance following the combination of the Neosho Crowder WWTP effluent with other water stored in the ponds. This permit, however, creates a point of compliance which is located prior to this mixing of effluent and receiving water in order to collect samples which are representative of the Neosho Crowder WWTP effluent. This location is identified as Internal Monitoring Point #IP2, located in the chlorine contact basin where effluent has been fully treated, including disinfection, at the Neosho Crowder WWTP. This location was established due to the fact that there is no opportunity to sample effluent once routed to the golf course irrigation ponds.

Internal Monitoring Point #IP2 includes quarterly monitoring only requirements for total phosphorus as demonstrated in Table A-7 of the permit.

**Combined Outfall #002 and Internal Monitoring Point #IP2 Comments:**

Due to the fact that this permit includes identical requirement for Outfall #002 and Internal Monitoring Point #IP2 for certain parameters, the permit writer has included both of these permitted features in Tables A-8, A-9, and A-10. Although the two permitted features are included in Tables A-8, A-9, and A-10 together, the requirements identified in these tables apply to the two permitted features separately. This means that if a discharge occurs from both Outfall #002 and Internal Monitoring Point #IP2 during a sampling period, the facility will be required to sample and report effluent results from both permitted feature locations separately. Sample results are not to be averaged between Outfall #002 and Internal Monitoring Point #IP2.

This permit includes the addition of a schedule of compliance to meet final effluent limitations at Outfall #002 and Internal Monitoring Point #IP2 for total recoverable chromium (III), dissolved chromium (VI), total recoverable copper, total recoverable lead, total recoverable mercury, total recoverable nickel, and total recoverable zinc.

It has been determined by the permit writer that expanded effluent testing requirements of the renewal application are not required for Outfall #002 or Internal Monitoring Point #IP2. Expanded effluent testing allows the permit writer to make determinations regarding potential effluent limitation or monitoring requirements, which will not be a result of this sampling at Outfall #002 or Internal Monitoring Point #IP2. Discharges from Outfall #002 historically are rare in frequency and occur during high flow events due to Inflow and Infiltration (I&I) into the collection system. As a result, samples taken from Outfall #002 would not be representative of the seasonal variation in the discharge since they will occur during the same stream and effluent conditions. Expanded effluent testing is required by the application for renewal at Outfall #001, which will include effluent from both wastewater plants and will allow for the permittee to collect samples representative of seasonal variation.

**EFFLUENT TABLE REQUIREMENTS BY PERMITTED FEATURE:**

| PERMITTED FEATURE                             | ASSOCIATED TABLE(S) IN PERMIT | COMMENTS                                                                                        |

**Part II – Operator Certification Requirements**

☒ - This facility is required to have a certified operator.

As per [10 CSR 20-6.010(8) Terms and Conditions of a Permit], the permittee shall operate and maintain facilities to comply with the Missouri Clean Water Law and applicable permit conditions and regulations. Operators or supervisors of operations at regulated wastewater treatment facilities shall be certified in accordance with [10 CSR 20-9.020(2)] and any other applicable state law or regulation. As per [10 CSR 20-9.020(2)(A)], requirements for operation by certified personnel shall apply to all wastewater treatment systems, if applicable, as listed below:

Owned or operated by or for a

☒ - Municipalities

☐ - Federal agency

☐ - County

☐ - Public Sewer District

☐ - State agency

☐ - Private Sewer Company regulated by the Public Service Commission

☐ - Public Water Supply Districts

Each of the above entities are only applicable if they have a Population Equivalent greater than two hundred (200) or fifty (50) or more service connections.

This facility currently requires an operator with an A Certification Level based on the Neosho WWTP as a whole (both the Neosho Crowder WWTP and Neosho Shoal Creek WWTP) due to the definition of wastewater treatment systems in 10 CSR 20-9.020(1)(A). Please see **Appendix - Classification Worksheet**. Modifications made to the wastewater treatment facility may cause the classification to be modified.

Operator's Name: Tim E. Parvin  
Certification Number: 9806  
Certification Level: A

The listing of the operator above only signifies that staff drafting this operating permit have reviewed appropriate Department records and determined that the name listed on the operating permit application has the correct and applicable Certification Level.

### **Part III– Operational Monitoring**

☒ - As per [10 CSR 20-9.010(4)], the facility is required to conduct operational monitoring.

### **Part IV – Receiving Stream Information**

**RECEIVING STREAM(S) TABLE: OUTFALL #001**

| WATER-BODY NAME | CLASS | WBID | DESIGNATED USES*                              | 12-DIGIT HUC  | DISTANCE TO CLASSIFIED SEGMENT (MI) |
|-----------------|-------|------|-----------------------------------------------|---------------|-------------------------------------|

\* As per 10 CSR 20-7.031 Missouri Water Quality Standards, the department defines the Clean Water Commission's water quality objectives in terms of "water uses to be maintained and the criteria to protect those uses." The receiving stream and 1<sup>st</sup> classified receiving stream's beneficial water uses to be maintained are in the receiving stream table in accordance with [10 CSR 20-7.031(1)(C)].

Uses which may be found in the receiving streams table, above:  
10 CSR 20-7.031(1)(C)1.:

**AQL** = Protection of aquatic life (Current narrative use(s) are defined to ensure the protection and propagation of fish shellfish and wildlife, which is further subcategorized as: **WWH** = Warm Water Habitat; **CDF** = Cold-water fishery (Current narrative use is cold-water habitat.); **CLF** = Cool-water fishery (Current narrative use is cool-water habitat); **EAH** = Ephemeral Aquatic Habitat; **MAH** = Modified Aquatic Habitat; **LAH** = Limited Aquatic Habitat. This permit uses AQL effluent limitations in 10 CSR 20-7.031 Table A for all habitat designations unless otherwise specified.)

10 CSR 20-7.031(1)(C)2.: Recreation in and on the water

**WBC** = Whole Body Contact recreation where the entire body is capable of being submerged;

**WBC-A** = Whole body contact recreation that supports swimming uses and has public access;

**WBC-B** = Whole body contact recreation that supports swimming;

**SCR** = Secondary Contact Recreation (like fishing, wading, and boating).

10 CSR 20-7.031(1)(C)3. to 7.:

**HHP** (formerly HHF) = Human Health Protection as it relates to the consumption of fish;

**IRR** = Irrigation for use on crops utilized for human or livestock consumption;

**LWW** = Livestock and wildlife watering (Current narrative use is defined as LWP = Livestock and Wildlife Protection);

**DWS** = Drinking Water Supply;

**IND** = Industrial water supply

10 CSR 20-7.031(1)(C)8-11.: Wetlands (10 CSR 20-7.031 Table A currently does not have corresponding habitat use criteria for these defined uses)

**WSA** = Storm- and flood-water storage and attenuation; **WHP** = Habitat for resident and migratory wildlife species;

**WRC** = Recreational, cultural, educational, scientific, and natural aesthetic values and uses; **WHC** = Hydrologic cycle maintenance.

10 CSR 20-7.031(6): **GRW** = Groundwater

### RECEIVING STREAM(S) LOW-FLOW VALUES:

#### **OUTFALL #001**

| RECEIVING STREAM | LOW-FLOW VALUES (CFS) |      |       |

### RECEIVING STREAM MONITORING REQUIREMENTS:

#### **OUTFALL #001**

Facilities with a design flow greater than 100,000 gallons per day are required to sample their effluent quarterly for total nitrogen and total phosphorus per 10 CSR 20-7.015(9)(D)7. Instream (Permitted Feature #SM1 – Upstream) monitoring for these parameters is necessary to determine background concentrations in order to complete calculations related to future effluent limit derivation where necessary or appropriate. Instream (Permitted Feature #SM2 – Downstream) total hardness data collected will be used to establish a site-specific hardness value which may be used in effluent limitations derivation calculations for hardness dependent metals.

#### **OUTFALL #002 & OUTFALL #003**

No receiving water monitoring requirements recommended at this time.

### **RECEIVING WATER BODY'S WATER QUALITY:**

#### **OUTFALL #001**

Outfall #001 discharges to a 303(d) listed stream. Shoal Creek (P) (3222) is listed on the 2016, originally 2014, Missouri 303(d) List for Zinc (S). The 2016 Missouri 303(d) List identifies the source of the impairment as Mill Tailings. It is unknown at this time if the facility is a source of the above listed pollutant(s) or considered to contribute to the impairment of Shoal Creek (P) (3222). Once a TMDL is developed, the permit may be modified to include WLAs from the TMDL.

#### **OUTFALL #002**

Outfall #002 discharges approximately 5.6 miles from a 303(d) listed stream. Buffalo Creek (P) (3273) is listed on the 2016, originally 2012, Missouri 303(d) List for Fishes Bioassessments/Unknown. It is unknown at this time if the facility is a source of the above listed pollutant(s) or considered to contribute to the impairment of Buffalo Creek (P) (3273). Once a TMDL is developed, the permit may be modified to include WLAs from the TMDL.

The Neosho Crowder WWTP discharges to a stream with an EPA approved TMDL. The majority of the time, the Neosho Crowder WWTP does not discharge to the Elk River basin and was therefore not included in the TMDL calculation. During normal flows, the effluent is piped from the Neosho Crowder WWTP to the Neosho Shoal Creek WWTP before being discharged into the Shoal Creek basin. Outfall #002, however, continues to exist in the Elk River basin and may discharge under high flow conditions. The TMDL states that if the City of Neosho chooses to maintain this potential discharge to the Elk River basin, a discharge limitation of 1.5 mg/L as a daily maximum for total phosphorus will be included in the permit. The TMDL also states that the alternative would be for the City of Neosho to eliminate Outfall #002. This requirement is reflected in this permit as a load-based daily maximum final effluent limitation in lbs/day.

#### **OUTFALL #003**

Effluent monitored at Internal Monitoring Point #IP2 discharges from Outfall #003, which is approximately 5.4 miles from a 303(d) listed stream. Buffalo Creek (P) (3273) is listed on the 2016, originally 2012, Missouri 303(d) List for Fishes Bioassessments / Unknown. It is unknown at this time if the facility is a source of the above listed pollutant(s) or considered to contribute to the impairment of Buffalo Creek (P) (3273). Once a TMDL is developed, the permit may be modified to include WLAs from the TMDL.

#### **Comments:**

Outfall #003 is the location at which effluent from the Neosho Crowder WWTP is discharged to the golf course irrigation storage ponds. These ponds and the potential discharge from these ponds are located within the same watershed as Outfall #002. However, Outfall #003 is not listed in the TMDL for the Elk River basin. Therefore, it has been determined by the permit writer that the requirements and assumption of the Elk River basin TMDL do not apply to Outfall #003 or the monitoring location Internal Monitoring Point #002.

## **Part V – Rationale and Derivation of Effluent Limitations & Permit Conditions**

### **ALTERNATIVE EVALUATIONS FOR NEW FACILITIES:**

As per [10 CSR 20-7.015(4)(A)], discharges to losing streams shall be permitted only after other alternatives including land application, discharges to a gaining stream and connection to a regional wastewater treatment facility have been evaluated and determined to be unacceptable for environmental and/or economic reasons.

☒ - The facility does not discharge to a Losing Stream as defined by [10 CSR 20-2.010(36)] & [10 CSR 20-7.031(1)(N)], or is an existing facility.

### **ANTI-BACKSLIDING:**

A provision in the Federal Regulations [CWA §303(d)(4); CWA §402(o); 40 CFR Part 122.44(l)] that requires a reissued permit to be as stringent as the previous permit with some exceptions.

☒ - Limitations in this operating permit for the reissuance of this permit conform to the anti-backsliding provisions of Section 402(o) of the Clean Water Act, and 40 CFR Part 122.44.

### **Outfall #001:**

☒ - Information is available which was not available at the time of permit issuance (other than revised regulations, guidance, or test methods) and which would have justified the application of a less stringent effluent limitation at the time of permit issuance.

- **pH.** The previous permit included final effluent limitations of 6.5-9.0 SU. However, pH limitations [10 CSR 20-7.015] are protective of the water quality standard [10 CSR 20-7.031(5)(E)], due to the buffering capacity of the mixing zone. Therefore, it has been determined by the permit writer that final effluent limitations of 6.0-9.0 SU be included in the permit.

- **Chromium (III), Total Recoverable.** The previous permit included final effluent limitations of 976.2 µg/L as a daily maximum and 389.3 µg/L as a monthly average. Over the previous five years, the permittee has reported non-detects which are less than the water quality standards. It has been determined by the permit writer that at this time no reasonable potential exists for this facility to exceed water quality criteria therefore, monitoring only requirements are included in this permit. Upon renewal, data collected will be reviewed to conduct a reasonable potential analysis in order to reevaluate this determination.
- **Chromium (VI), Dissolved.** The previous permit included final effluent limitations of 20.3 µg/L as a daily maximum and 8.1 µg/L as a monthly average. As a result of a reasonable potential analysis, it has been determined that there is no reasonable potential to violate water quality standards. Therefore, it has been determined by the permit writer that monitoring only requirements be included in this permit. Upon renewal, data collected will be reviewed to conduct a reasonable potential analysis in order to reevaluate this determination.
- **Whole Effluent Toxicity (WET) test.** WET testing requirements were changed from pass/fail to monitoring only for toxic units. This change reflects modifications to Missouri's Effluent Regulation found at 10 CSR 20-7.015. 40 CFR 122.44(d)(1)(ii) requiring the department to establish effluent limitations to control all parameters which have the reasonable potential to cause or contribute to an excursion above any state water quality standard, including state narrative criteria. The previous permit imposed a pass/fail limitation without collecting sufficient numerical data to conduct an analytical reasonable potential analysis. The permit writer has made a reasonable potential determination which concluded the facility does not have reasonable potential at this time but monitoring is required. Implementation of the toxic unit monitoring requirement will allow the department to effect numeric criteria in accordance with water quality standards established under §303 of the CWA.

**Outfall #002:**

- ☒ - Information is available which was not available at the time of permit issuance (other than revised regulations, guidance, or test methods) and which would have justified the application of a less stringent effluent limitation at the time of permit issuance.
- **Escherichia coli (E. coli).** The previous permit included final effluent limitations of 126 #/100 mL as a daily maximum and monthly average. Discharges to losing streams shall not exceed 126 #/100 mL as a daily maximum at any time, as per 10 CSR 20-7.031(5)(C) and monitoring only for a monthly average, as no more than 10% of samples over the course of the calendar year shall exceed 126 #/100 mL daily maximum as per 10 CSR 20-7.015(9)(B)1.G. Therefore, this permit includes final effluent limitations of 126 #/100 mL as a daily maximum and monitoring only requirements as a monthly average.
  - **Nitrates as N.** The previous permit included final effluent limitations of 20 mg/L as a daily maximum and 10 mg/L as a monthly average in order to protect both groundwater and drinking water. After review of discharge monitoring reports over the previous five years, the permit writer made a reasonable potential determination that there is no reasonable potential to exceed the water quality standard for nitrates at this time. However, monitoring only requirements have been included in the permit in order to verify this determination. Data collected will be reviewed upon renewal to determine if an effluent limitation is necessary to protect water quality.
  - **Whole Effluent Toxicity (WET) test.** The previous permit included requirements to conduct an Acute WET test once every year at the Neosho Crowder WWTP (Outfall #002). However, when a discharge occurs at Outfall #002, it is due to high flow events caused by Inflow and Infiltration (I&I). These discharges have been determined to not be representative of the facility's performance by the permit writer due to dilution of the effluent. Additionally, WET testing should occur during critical low flow scenarios, which will not be the conditions of the receiving stream at the time of a discharge from Outfall #002. During normal flow conditions, the effluent from Outfall #002 is sent to the Neosho Shoal Creek WWTP (Outfall #001) where the effluents combine prior to sample collection for WET test purposes. This means that when the permittee collects a sample at Outfall #001 for WET test requirements, effluent from the Neosho Crowder WWTP, which is representative of normal flow conditions, will be included in the sample for compliance with WET test requirements of Outfall #001. Therefore, it has been determined by the permit writer that WET testing requirements be removed for Outfall #002 in this permit.
- ☒ - The Department determines that technical mistakes or mistaken interpretations of law were made in issuing the permit under section 402(a)(1)(b).
- **1,2-dichloroethane, 1,1,2-trichloroethane, Cyanide (Amenable to Chlorination), Phenol, Total Dissolved Boron, & Total Recoverable Lead.** It has been determined by the permit writer that derivation of final effluent limitations for the above listed parameters were done so incorrectly. Therefore, effluent limitations have been reevaluated for the purposes of this permit renewal. As a result, final effluent limitations included in this permit are less stringent than previously established. These effluent limitations are still protective of water quality standards. Data collected will be reviewed upon renewal to verify these determinations.

**ANTIDEGRADATION:**

In accordance with Missouri's Water Quality Standard [10 CSR 20-7.031(3)], for domestic wastewater discharge with new, altered, or expanding discharges, the Department is to document by means of Antidegradation Review that the use of a water body's available assimilative capacity is justified. In accordance with Missouri's water quality regulations for antidegradation [10 CSR 20-7.031(3)], degradation may be justified by documenting the socio-economic importance of a discharge after determining the necessity of the discharge. Facilities must submit the antidegradation review request to the department prior to establishing, altering, or expanding discharges. See <http://dnr.mo.gov/env/wpp/permits/antideg-implementation.htm>

☒ - No degradation proposed and no further review necessary. Facility did not apply for authorization to increase pollutant loading or to add additional pollutants to their discharge.

For stormwater discharges with new, altered, or expanding discharges, the stormwater BMP chosen for the facility, through the antidegradation analysis performed by the facility, must be implemented and maintained at the facility. Failure to implement and maintain the chosen BMP alternative is a permit violation; see SWPPP.

**AREA-WIDE WASTE TREATMENT MANAGEMENT & CONTINUING AUTHORITY:**

As per [10 CSR 20-6.010(3)(B)], ...An applicant may utilize a lower preference continuing authority by submitting, as part of the application, a statement waiving preferential status from each existing higher preference authority, providing the waiver does not conflict with any area-wide management plan approved under section 208 of the Federal Clean Water Act or any other regional sewage service and treatment plan approved for higher preference authority by the Department.

**BIOSOLIDS & SEWAGE SLUDGE:**

Biosolids are solid materials resulting from domestic wastewater treatment that meet federal and state criteria for beneficial uses (i.e. fertilizer). Sewage sludge is solids, semi-solids, or liquid residue generated during the treatment of domestic sewage in a treatment works; including but not limited to, domestic septage; scum or solids removed in primary, secondary, or advanced wastewater treatment process; and a material derived from sewage sludge. Sewage sludge does not include ash generated during the firing of sewage sludge in a sewage sludge incinerator or grit and screening generated during preliminary treatment of domestic sewage in a treatment works. Additional information regarding biosolids and sludge is located at the following web address: <http://extension.missouri.edu/main/DisplayCategory.aspx?C=74>, items WQ422 through WQ449.

☒ - Permittee has and a Department approved biosolids management plan, and is authorized to land applies biosolids in accordance with Standard Conditions III.

**COMPLIANCE AND ENFORCEMENT:**

Enforcement is the action taken by the Water Protection Program (WPP) to bring an entity into compliance with the Missouri Clean Water Law, its implementing regulations, and/or any terms and conditions of an operating permit. The primary purpose of the enforcement activity in the WPP is to resolve violations and return the entity to compliance.

☒ - The facility is not currently under Water Protection Program enforcement action.

**ELECTRONIC DISCHARGE MONITORING REPORT (EDMR) SUBMISSION SYSTEM:**

The U.S. Environmental Protection Agency (EPA) promulgated a final rule on October 22, 2015, to modernize Clean Water Act reporting for municipalities, industries, and other facilities by converting to an electronic data reporting system. This final rule requires regulated entities and state and federal regulators to use information technology to electronically report data required by the National Pollutant Discharge Elimination System (NPDES) permit program instead of filing paper reports. To comply with the federal rule, the Department is requiring all permittees to begin submitting discharge monitoring data and reports online.

Per 40 CFR 127.15 and 127.24, permitted facilities may request a temporary waiver for up to 5 years or a permanent waiver from electronic reporting from the Department. To obtain an electronic reporting waiver, a permittee must first submit an eDMR Waiver Request Form: <http://dnr.mo.gov/forms/780-2692-f.pdf>. A request must be made for each facility. If more than one facility is owned or operated by a single entity, then the entity must submit a separate request for each facility based on its specific circumstances. An approved waiver is non-transferable.

The Department must review and notify the facility within 120 calendar days of receipt if the waiver request has been approved or rejected [40 CFR 124.27(a)]. During the Department review period as well as after a waiver is granted, the facility must continue submitting a hard-copy of any reports required by their permit. The Department will enter data submitted in hard-copy from those facilities allowed to do so and electronically submit the data to the EPA on behalf of the facility.

☒ - The permittee/facility is not currently using the eDMR data reporting system. The permittee shall submit an eDMR Permit Holder and Certifier Registration form **within 90 days of the effective date** of this permit.

**PRETREATMENT PROGRAM:**

The reduction of the amount of pollutants, the elimination of pollutants, or the alteration of the nature of pollutant properties in wastewater prior to or in lieu of discharging or otherwise introducing such pollutants into a Publicly Owned Treatment Works [40 CFR Part 403.3(q)].

Pretreatment programs are required at any POTW (or combination of POTW operated by the same authority) and/or municipality with a total design flow greater than 5.0 MGD and receiving industrial wastes that interfere with or pass through the treatment works or are otherwise subject to the pretreatment standards. Pretreatment programs can also be required at POTWs/municipals with a design flow less than 5.0 MGD if needed to prevent interference with operations or pass through.

Several special conditions pertaining to the permittee's pretreatment program may be included in the permit, and are as follows:

- Implementation and enforcement of the program,
- Annual pretreatment report submittal,
- Submittal of list of industrial users,
- Technical evaluation of need to establish local limitations, and
- Submittal of the results of the evaluation

☒ - This permittee has an approved pretreatment program in accordance with the requirements of [40 CFR Part 403] and [10 CSR 20-6.100] and is expected to implement and enforce its approved program.

**REASONABLE POTENTIAL ANALYSIS (RPA):**

Federal regulation [40 CFR Part 122.44(d)(1)(i)] requires effluent limitations for all pollutants that are or may be discharged at a level that will cause or have the reasonable potential to cause or contribute to an in-stream excursion above narrative or numeric water quality standard.

In accordance with [40 CFR Part 122.44(d)(1)(iii)] if the permit writer determines that any given pollutant has the reasonable potential to cause, or contribute to an in-stream excursion above the WQS, the permit must contain effluent limits for that pollutant.

☒ - A RPA was conducted on appropriate parameters. Please see **APPENDIX – RPA RESULTS**.

**REMOVAL EFFICIENCY:**

Removal efficiency is a method by which the Federal Regulations define Secondary Treatment and Equivalent to Secondary Treatment, which applies to Biochemical Oxygen Demand 5-day (BOD<sub>5</sub>) and Total Suspended Solids (TSS) for Publicly Owned Treatment Works (POTWs)/municipals.

**Outfall #001:** Secondary Treatment is 85% removal [40 CFR Part 133.102(a)(3) & (b)(3)].

**Outfall #002:** Equivalent to Secondary Treatment is 65% removal [40 CFR Part 133.105(a)(3) & (b)(3)].

**SANITARY SEWER OVERFLOWS (SSO) AND INFLOW AND INFILTRATION (I&I):**

Sanitary Sewer Overflows (SSOs) are defined as untreated sewage releases and are considered bypassing under state regulation [10 CSR 20-2.010(11)] and should not be confused with the federal definition of bypass. SSOs result from a variety of causes including blockages, line breaks, and sewer defects that can either allow wastewater to backup within the collection system during dry weather conditions or allow excess stormwater and groundwater to enter and overload the collection system during wet weather conditions. SSOs can also result from lapses in sewer system operation and maintenance, inadequate sewer design and construction, power failures, and vandalism. SSOs include overflows out of manholes, cleanouts, broken pipes, and other into waters of the state and onto city streets, sidewalks, and other terrestrial locations.

Inflow and Infiltration (I&I) is defined as unwanted intrusion of stormwater or groundwater into a collection system. This can occur from points of direct connection such as sump pumps, roof drain downspouts, foundation drains, and storm drain cross-connections or through cracks, holes, joint failures, faulty line connections, damaged manholes, and other openings in the collection system itself. I&I results from a variety of causes including line breaks, improperly sealed connections, cracks caused by soil erosion/settling, penetration of vegetative roots, and other sewer defects. In addition, excess stormwater and groundwater entering the collection system from line breaks and sewer defects have the potential to negatively impact the treatment facility.

Missouri RSMo §644.026.1.(13) mandates that the Department issue permits for discharges of water contaminants into the waters of this state, and also for the operation of sewer systems. Such permit conditions shall ensure compliance with all requirements as established by sections 644.006 to 644.141. Standard Conditions Part I, referenced in the permit, contains provisions requiring proper operation and maintenance of all facilities and systems of treatment and control. Missouri RSMo §644.026.1.(15) instructs the Department to require proper maintenance and operation of treatment facilities and sewer systems and proper disposal of residual waste from all such facilities. To ensure that public health and the environment are protected, any noncompliance which may endanger public health or the environment must be reported to the Department within 24 hours of the time the permittee becomes

aware of the noncompliance. Standard Conditions Part I, referenced in the permit, contains the reporting requirements for the permittee when bypasses and upsets occur. The permit also contains requirements for permittees to develop and implement a program for maintenance and repair of the collection system. The permit requires that the permittee submit an annual report to the Department for the previous calendar year that contains a summary of efforts taken by the permittee to locate and eliminate sources of excess I & I, a summary of general maintenance and repairs to the collection system, and a summary of any planned maintenance and repairs to the collection system for the upcoming calendar year.

☒ - At this time, the Department recommends the US EPA's Guide for Evaluating Capacity, Management, Operation and Maintenance (CMOM) Programs At Sanitary Sewer Collection Systems (Document # EPA 305-B-05-002) or the Departments' CMOM Model located at <http://dnr.mo.gov/env/wpp/permits/docs/cmom-template.doc>. For additional information regarding the Departments' CMOM Model, see the CMOM Plan Model Guidance document at <http://dnr.mo.gov/pubs/pub2574.htm>. The CMOM identifies some of the criteria used to evaluate a collection system's management, operation, and maintenance and was intended for use by the EPA, state, regulated community, and/or third party entities. The CMOM is applicable to small, medium, and large systems; both public and privately owned; and both regional and satellite collection systems. The CMOM does not substitute for the Clean Water Act, the Missouri Clean Water Law, and both federal and state regulations, as it is not a regulation.

#### **SCHEDULE OF COMPLIANCE (SOC):**

Per 644.051.4 RSMo, a permit may be issued with a Schedule of Compliance (SOC) to provide time for a facility to come into compliance with new state or federal effluent regulations, water quality standards, or other requirements. Such a schedule is not allowed if the facility is already in compliance with the new requirement, or if prohibited by other statute or regulation. A SOC includes an enforceable sequence of interim requirements (actions, operations, or milestone events) leading to compliance with the Missouri Clean Water Law, its implementing regulations, and/or the terms and conditions of an operating permit. *See also* Section 502(17) of the Clean Water Act, and 40 CFR §122.2. For new effluent limitations, the permit includes interim monitoring for the specific parameter to demonstrate the facility is not already in compliance with the new requirement. Per 40 CFR § 122.47(a)(1) and 10 CSR 20-7.031(11), compliance must occur as soon as possible. If the permit provides a schedule for meeting new water quality based effluent limits, a SOC must include an enforceable, final effluent limitation in the permit even if the SOC extends beyond the life of the permit.

A SOC is not allowed:

- For effluent limitations based on technology-based standards established in accordance with federal requirements, if the deadline for compliance established in federal regulations has passed. 40 CFR § 125.3.
- For a newly constructed facility in most cases. Newly constructed facilities must meet applicable effluent limitations when discharge begins, because the facility has installed the appropriate control technology as specified in a permit or antidegradation review. A SOC is allowed for a new water quality based effluent limit that was not included in a previously public noticed permit or antidegradation review, which may occur if a regulation changes during construction.
- To develop a TMDL, UAA, or other study associated with development of a site specific criterion. A facility is not prohibited from conducting these activities, but a SOC may not be granted for conducting these activities.

In order to provide guidance to Permit Writers in developing SOC's, and attain a greater level of consistency, on April 9, 2015 the Department issued an updated policy on development of SOC's. This policy provides guidance to Permit Writers on the standard time frames for schedules for common activities, and guidance on factors that may modify the length of the schedule such as a Cost Analysis for Compliance.

☒ - The time given for effluent limitations of this permit listed under Interim Effluent Limitation and Final Effluent Limitations were established in accordance with [10 CSR 20-7.031(11)].

#### **Outfall #001:**

The facility has been given a schedule of compliance to meet final effluent limits for ammonia, phenol, total recoverable cadmium, total recoverable iron, and total recoverable selenium. The existing oxidation ditch facility employs technology capable of meeting the proposed final effluent limitations for ammonia, but discharge monitoring reports indicate the facility has not always been in compliance with the proposed limitations. Therefore this permit includes a one (1) year schedule of compliance to make sufficient operational changes so that consistent compliance with final effluent limitations for ammonia is attained at Outfall #001. As a result of a Reasonable Potential Analysis (RPA), it has been determined that the facility has a reasonable potential to exceed water quality standards for the above listed parameters. Due to the fact that these are new and more stringent effluent limitations, the facility has requested a schedule of compliance to meet final effluent limitations. Therefore, this permit includes a one (1) year schedule of compliance to make sufficient operational changes so that consistent compliance with final effluent limitations for ammonia is attained at Outfall #001.

**Outfall #002:**

The facility has been given a schedule of compliance to meet final effluent limits for total phosphorus. The five (5) year schedule of compliance allowed for this facility should provide adequate time to evaluate operations, obtain an engineering report, obtain a construction permit and implement upgrades required to meet effluent limits. Due to the economic burden on this community of the cost of compliance and associated difficulty in raising the necessary funding, the schedule has been established at five (5) years in accordance with the Department's "Schedule of Compliance, Policy for Staff Drafting Operating Permits". Please see the Cost Analysis for Compliance attached as an appendix to the permit for further detail on how the socio-economic status of the community has impacted this SOC.

**Outfall #002 and Internal Monitoring Point #IP2:**

The facility has been given a schedule of compliance to meet final effluent limits for total recoverable chromium (III), dissolved chromium (VI), total recoverable copper, total recoverable lead, total recoverable mercury, total recoverable nickel, and total recoverable zinc. As a result of technical mistakes noticed by the permit writer, this permit includes new and more stringent effluent limitations than those of the previous permit for the above listed parameters. Due to the fact that these are new and more stringent effluent limitations and the limited amount of effluent data related to the above listed parameters, the facility has requested a schedule of compliance to meet final effluent limitations. Therefore, this permit includes a one (1) year schedule of compliance to make sufficient operational changes so that consistent compliance with final effluent limitations for ammonia is attained at Outfall #001.

**SEWER EXTENSION AUTHORITY SUPERVISED PROGRAM:**

In accordance with [10 CSR 20-6.010(6)(A)], the department may grant approval of a permittee's Sewer Extension Authority Supervised Program. These approved permittees regulate and approve construction of sanitary sewers and pump stations, which are tributary to this wastewater treatment facility. The permittee shall act as the continuing authority for the operation, maintenance, and modernization of the constructed collection system. See <http://dnr.mo.gov/env/wpp/permits/sewer-extension.htm>.

☒ - The permittee does not have a department approved Sewer Extension Authority Supervised Program.

**STORMWATER POLLUTION PREVENTION PLAN (SWPPP):**

In accordance with 40 CFR 122.44(k) *Best Management Practices (BMPs)* to control or abate the discharge of pollutants when: (1) Authorized under section 304(e) of the Clean Water Act (CWA) for the control of toxic pollutants and hazardous substances from ancillary industrial activities; (2) Authorized under section 402(p) of the CWA for the control of stormwater discharges; (3) Numeric effluent limitations are infeasible; or (4) the practices are reasonably necessary to achieve effluent limitations and standards or to carry out the purposes and intent of the CWA.

In accordance with the EPA's *Developing Your Stormwater Pollution Prevention Plan, A Guide for Industrial Operators*, (Document number EPA 833-B-09-002) [published by the United States Environmental Protection Agency (USEPA) in February 2009], BMPs are measures or practices used to reduce the amount of pollution entering (regarding this operating permit) waters of the state. BMPs may take the form of a process, activity, or physical structure.

Additionally in accordance with the Stormwater Management, a SWPPP is a series of steps and activities to (1) identify sources of pollution or contamination, and (2) select and carry out actions which prevent or control the pollution of stormwater discharges. The purpose of a SWPPP is to comply with all applicable stormwater regulations by creating an adaptive management plan to control and mitigate stream pollution from stormwater runoff. Developing a SWPPP provides opportunities to employ appropriate BMPs to minimize the risk of pollutants being discharged during storm events. The following paragraph outlines the general steps the permittee should take to determine which BMPs will work to achieve the benchmark values or limits in the permit. This section is not intended to be all encompassing or restrict the use of any physical BMP or operational and maintenance procedure assisting in pollution control. Additional steps or revisions to the SWPPP may be required to meet the requirements of the permit.

Areas which should be included in the SWPPP are identified in 40 CFR 122.26(b)(14). Once the potential sources of stormwater pollution have been identified, a plan should be formulated to best control the amount of pollutant being released and discharged by each activity or source. This should include, but is not limited to, minimizing exposure to stormwater, good housekeeping measures, proper facility and equipment maintenance, spill prevention and response, vehicle traffic control, and proper materials handling. Once a plan has been developed the facility will employ the control measures determined to be adequate to achieve the benchmark values discussed above. The facility will conduct monitoring and inspections of the BMPs to ensure they are working properly and re-evaluate any BMP not achieving compliance with permitting requirements. For example, if sample results from an outfall show values of TSS above the benchmark value, the BMP being employed is deficient in controlling stormwater pollution. Corrective action should be taken to repair, improve, or replace the failing BMP. This internal evaluation is required at least once per month but should be continued more frequently if BMPs continue to fail. If failures do occur, continue this trial and error process until appropriate BMPs have been established.

For new, altered, or expanded stormwater discharges, the SWPPP shall identify reasonable and effective BMPs while accounting for environmental impacts of varying control methods. The antidegradation analysis must document why no discharge or no exposure options are not feasible. The selection and documentation of appropriate control measures shall serve as an alternative analysis of

technology and fulfill the requirements of antidegradation [10 CSR 20-7.031(3)]. For further guidance, consult the antidegradation implementation procedure (<http://dnr.mo.gov/env/wpp/docs/AIP050212.pdf>).

Alternative Analysis (AA) evaluation of the BMPs is a structured evaluation of BMPs that are reasonable and cost effective. The AA evaluation should include practices that are designed to be: 1) non-degrading; 2) less degrading; or 3) degrading water quality. The glossary of AIP defines these three terms. The chosen BMP will be the most reasonable and effective management strategy while ensuring the highest statutory and regulatory requirements are achieved and the highest quality water attainable for the facility is discharged. The AA evaluation must demonstrate why “no discharge” or “no exposure” is not a feasible alternative at the facility. This structured analysis of BMPs serves as the antidegradation review, fulfilling the requirements of 10 CSR 20-7.031(3) Water Quality Standards and *Antidegradation Implementation Procedure* (AIP), Section II.B.

If parameter-specific numeric exceedances continue to occur and the permittee feels there are no practicable or cost-effective BMPs which will sufficiently reduce a pollutant concentration in the discharge to the benchmark values established in the permit, the permittee can submit a request to re-evaluate the benchmark values. This request needs to include 1) a detailed explanation of why the facility is unable to comply with the permit conditions and unable to establish BMPs to achieve the benchmark values; 2) financial data of the company and documentation of cost associated with BMPs for review and 3) the SWPPP, which should contain adequate documentation of BMPs employed, failed BMPs, corrective actions, and all other required information. This will allow the department to conduct a cost analysis on control measures and actions taken by the facility to determine cost-effectiveness of BMPs. The request shall be submitted in the form of an operating permit modification; the application is found at: <http://dnr.mo.gov/forms/index.html>.

☒ - 10 CSR 20-6.200 and 40 CFR 122.26 includes treatment works treating domestic sewage or any other sewage sludge or wastewater treatment device or system, used in the storage treatment, recycling, and reclamation of municipal or domestic sewage, including land dedicated to the disposal of sewage sludge that is located within the confines of the facility, with a design flow of 1.0 mgd or more, or are required to have an approved pretreatment program under 40 CFR part 403, as an industrial activity in which permit coverage is required.

In lieu of requiring sampling in the site-specific permit, the facility is required to develop and implement a Stormwater Pollution Prevention Plan. A facility can apply for conditional exclusion for “no exposure” of industrial activities and materials to stormwater by submitting to the Department a completed NPDES Form 3510-11 – No Exposure Certification for Exclusion from NPDES Stormwater Permitting. That document can be found at [https://www3.epa.gov/npdes/pubs/msgp2008\\_appendixk.pdf](https://www3.epa.gov/npdes/pubs/msgp2008_appendixk.pdf) and additional information may be found at <https://www.epa.gov/npdes/stormwater-discharges-industrial-activities#exclusion>. Upon approval of the “No Exposure”, the permit can be modified to remove the SWPPP requirements. If the facility chooses to retain the conditional exclusion for “no exposure”, the facility is required to renew the “No Exposure” exemption during the permit renewal period by submitting NPDES Form 3510-11 with Form B2.

#### **VARIANCE:**

As per the Missouri Clean Water Law § 644.061.4, variances shall be granted for such period of time and under such terms and conditions as shall be specified by the commission in its order. The variance may be extended by affirmative action of the commission. In no event shall the variance be granted for a period of time greater than is reasonably necessary for complying with the Missouri Clean Water Law §§644.006 to 644.141 or any standard, rule or regulation promulgated pursuant to Missouri Clean Water Law §§644.006 to 644.141.

☒ - This operating permit is not drafted under premises of a petition for variance.

#### **WASTELOAD ALLOCATIONS (WLA) FOR LIMITS:**

As per [10 CSR 20-2.010(78)], the amount of pollutant each discharger is allowed by the Department to release into a given stream after the Department has determined total amount of pollutant that may be discharged into that stream without endangering its water quality.

☒ - Wasteload allocations were calculated where applicable using water quality criteria or water quality model results and the dilution equation below:

$$C_e = \frac{(Q_e + Q_s)C - (Q_s \times C_s)}{(Q_e)} \quad (\text{EPA/505/2-90-001, Section 4.5.5})$$

Where C = downstream concentration      C<sub>e</sub> = effluent concentration  
Cs = upstream concentration              Q<sub>e</sub> = effluent flow  
Q<sub>s</sub> = upstream flow

Chronic wasteload allocations were determined using applicable chronic water quality criteria (CCC: criteria continuous concentration) and stream volume of flow at the edge of the mixing zone (MZ). Acute wasteload allocations were

determined using applicable water quality criteria (CMC: criteria maximum concentration) and stream volume of flow at the edge of the zone of initial dilution (ZID).

Water quality based maximum daily and average monthly effluent limitations were calculated using methods and procedures outlined in USEPA's "Technical Support Document For Water Quality-based Toxics Control" (EPA/505/2-90-001).

**Number of Samples "n":**

Additionally, in accordance with the TSD for water quality-based permitting, effluent quality is determined by the underlying distribution of daily values, which is determined by the Long Term Average (LTA) associated with a particular Wasteload Allocation (WLA) and by the Coefficient of Variation (CV) of the effluent concentrations. Increasing or decreasing the monitoring frequency does not affect this underlying distribution or treatment performance, which should be, at a minimum, be targeted to comply with the values dictated by the WLA. Therefore, it is recommended that the actual planned frequency of monitoring normally be used to determine the value of "n" for calculating the AML. However, in situations where monitoring frequency is once per month or less, a higher value for "n" must be assumed for AML derivation purposes. Thus, the statistical procedure being employed using an assumed number of samples is "n = 4" at a minimum. For Total Ammonia as Nitrogen, "n = 30" is used.

**WLA MODELING:**

There are two general types of effluent limitations, technology-based effluent limits (TBELs) and water quality based effluent limits (WQBELs). If TBELs do not provide adequate protection for the receiving waters, then WQBEL must be used.

☒ - A WLA study was either not submitted or determined not applicable by Department staff.

**WATER QUALITY STANDARDS:**

Per [10 CSR 20-7.031(4)], General Criteria shall be applicable to all waters of the state at all times including mixing zones. Additionally, [40 CFR 122.44(d)(1)] directs the Department to establish in each NPDES permit to include conditions to achieve water quality established under Section 303 of the Clean Water Act, including State narrative criteria for water quality.

**WHOLE EFFLUENT TOXICITY (WET) TEST:**

**Outfall #001:** The permittee is required to conduct WET test for this facility.

A WET test is a quantifiable method of determining if a discharge from a facility may be causing toxicity to aquatic life by itself, in combination with or through synergistic responses when mixed with receiving stream water.

Under the federal Clean Water Act (CWA) §101(a)(3), requiring WET testing is reasonably appropriate for site-specific Missouri State Operating Permits for discharges to waters of the state issued under the National Pollutant Discharge Elimination System (NPDES). WET testing is also required by 40 CFR 122.44(d)(1). WET testing ensures that the provisions in the 10 CSR 20-6.010(8)(A)7. and the Water Quality Standards 10 CSR 20-7.031(4)(D),(F),(G),(I)2.A & B are being met. Under [10 CSR 20-6.010(8)(A)4], the Department may require other terms and conditions that it deems necessary to assure compliance with the Clean Water Act and related regulations of the Missouri Clean Water Commission. In addition the following MCWL apply: §§644.051.3 requires the Department to set permit conditions that comply with the MCWL and CWA; 644.051.4 specifically references toxicity as an item we must consider in writing permits (along with water quality-based effluent limits, pretreatment, etc...); and 644.051.5 is the basic authority to require testing conditions. WET test will be required by facilities meeting the following criteria:

- ☒ Facility is a designated Major.
- ☐ Facility continuously or routinely exceeds its design flow.
- ☐ Facility that exceeds its design population equivalent (PE) for BOD<sub>5</sub> whether or not its design flow is being exceeded.
- ☐ Facility (whether primarily domestic or industrial) that alters its production process throughout the year.
- ☒ Facility handles large quantities of toxic substances, or substances that are toxic in large amounts.
- ☒ Facility has Water Quality-based Effluent Limitations for toxic substances (other than NH<sub>3</sub>).
- ☒ Facility is a municipality with a Design Flow ≥ 22,500 gpd.

**Outfall #002:** At this time, the permittee is not required to conduct WET test for this facility.

**40 CFR 122.41(M) - BYPASSES:**

The federal Clean Water Act (CWA), Section 402 prohibits wastewater dischargers from "bypassing" untreated or partially treated sewage (wastewater) beyond the headworks. A bypass is defined as an intentional diversion of waste streams from any portion of a treatment facility, [40 CFR 122.41(m)(1)(i)]. Additionally, Missouri regulation 10 CSR 20-7.015(9)(G) states a bypass means the intentional diversion of waste streams from any portion of a treatment facility, except in the case of blending, to waters of the state. Only under exceptional and specified limitations do the federal regulations allow for a facility to bypass some or all of the flow from its treatment process. Bypasses are prohibited by the CWA unless a permittee can meet all of the criteria listed in 40 CFR

122.41(m)(4)(i)(A), (B), & (C). Any bypasses from this facility are subject to the reporting required in 40 CFR 122.41(l)(6) and per Missouri's Standard Conditions I, Section B, part 2.b. Additionally, Anticipated Bypasses include bypasses from peak flow basins or similar devices designed for peak wet weather flows.

☒ - This facility does not anticipate bypassing.

### **303(d) LIST & TOTAL MAXIMUM DAILY LOAD (TMDL):**

Section 303(d) of the federal Clean Water Act requires that each state identify waters that are not meeting water quality standards and for which adequate water pollution controls have not been required. Water quality standards protect such beneficial uses of water as whole body contact (such as swimming), maintaining fish and other aquatic life, and providing drinking water for people, livestock and wildlife. The 303(d) list helps state and federal agencies keep track of waters that are impaired but not addressed by normal water pollution control programs.

A TMDL is a calculation of the maximum amount of a given pollutant that a body of water can absorb before its water quality is affected. If a water body is determined to be impaired as listed on the 303(d) list, then a watershed management plan will be developed that shall include the TMDL calculation

**Outfall #001:** Outfall #001 discharges to a 303(d) listed stream. Shoal Creek (P) (3222) is listed on the 2016, originally 2014, Missouri 303(d) List for Zinc (S). The 2016 Missouri 303(d) List identifies the source of the impairment as Mill Tailings. It is unknown at this time if the facility is a source of the above listed pollutant(s) or considered to contribute to the impairment of Shoal Creek (P) (3222). Once a TMDL is developed, the permit may be modified to include WLAs from the TMDL.

**Outfall #002:** Outfall #002 discharges approximately 5.6 miles from a 303(d) listed stream. Buffalo Creek (P) (3273) is listed on the 2016, originally 2012, Missouri 303(d) List for Fishes Bioassessments/Unknown. It is unknown at this time if the facility is a source of the above listed pollutant(s) or considered to contribute to the impairment of Buffalo Creek (P) (3273). Once a TMDL is developed, the permit may be modified to include WLAs from the TMDL.

The Neosho Crowder WWTP discharges to a stream with an EPA approved TMDL. The majority of the time, the Neosho Crowder WWTP does not discharge to the Elk River basin and was therefore not included in the TMDL calculation. During normal flows, the effluent is piped from the Neosho Crowder WWTP to the Neosho Shoal Creek WWTP before being discharged into the Shoal Creek basin. Outfall #002, however, continues to exist in the Elk River basin and may discharge under high flow conditions. The TMDL states that if the City of Neosho chooses to maintain this potential discharge to the Elk River basin, a discharge limitation of 1.5 mg/L as a daily maximum for total phosphorus will be included in the permit. The TMDL also states that the alternative would be for the City of Neosho to eliminate Outfall #002. This requirement is reflected in this permit as a load-based daily maximum final effluent limitation in lbs/day.

**Outfall #003:** Effluent monitored at Internal Monitoring Point #IP2 discharges from Outfall #003, which is approximately 5.4 miles from a 303(d) listed stream. Buffalo Creek (P) (3273) is listed on the 2016, originally 2012, Missouri 303(d) List for Fishes Bioassessments / Unknown. It is unknown at this time if the facility is a source of the above listed pollutant(s) or considered to contribute to the impairment of Buffalo Creek (P) (3273). Once a TMDL is developed, the permit may be modified to include WLAs from the TMDL.

Outfall #003 is the location at which effluent from the Neosho Crowder WWTP is discharged to the golf course irrigation storage ponds. These ponds and the potential discharge from these ponds are located within the same watershed as Outfall #002. However, Outfall #003 is not listed in the TMDL for the Elk River basin. Therefore, it has been determined by the permit writer that the requirements and assumption of the Elk River basin TMDL do not apply to Outfall #003 or the monitoring location Internal Monitoring Point #002.

## **Part VI –2013 Water Quality Criteria for Ammonia**

Upcoming changes to the Water Quality Standard for ammonia may require significant upgrades to wastewater treatment facilities.

On August 22, 2013, the U.S. Environmental Protection Agency (EPA) finalized new water quality criteria for ammonia, based on toxicity studies of mussels and gill breathing snails. Missouri's current ammonia criteria are based on toxicity testing of several species, but did not include data from mussels or gill breathing snails. Missouri is home to 69 of North America's mussel species, which are spread across the state. According to the Missouri Department of Conservation nearly two-thirds of the mussel species in Missouri are considered to be "of conservation concern". Nine species are listed as federally endangered, with an additional species currently proposed as endangered and another species proposed as threatened.

The adult forms of mussels that are seen in rivers, lakes, and streams are sensitive to pollutants because they are sedentary filter feeders. They vacuum up many pollutants with the food they bring in and cannot escape to new habitats, so they can accumulate

toxins in their bodies and die. But very young mussels, called glochidia, are exceptionally sensitive to ammonia in water. As a result of a citizen suit, the EPA was compelled to conduct toxicity testing and develop ammonia water quality criteria that would be protective if young mussels may be present in a waterbody. These new criteria will apply to any discharge with ammonia levels that may pose a reasonable potential to violate the standards. Nearly all discharging domestic wastewater treatment facilities (cities, subdivisions, mobile home parks, etc.), as well as certain industrial and stormwater dischargers with ammonia in their effluent, will be affected by this change in the regulations.

When new water quality criteria are established by the EPA, states must adopt them into their regulations in order to keep their authorization to issue permits under the National Pollutant Discharge Elimination System (NPDES). States are required to review their water quality standards every three years, and if new criteria have been developed they must be adopted. States may be more protective than the Federal requirements, but not less protective. Missouri does not have the resources to conduct the studies necessary for developing new water quality standards, and therefore our standards mirror those developed by the EPA; however, we will utilize any available flexibility based on actual species of mussels that are native to Missouri and their sensitivity to ammonia.

Many treatment facilities in Missouri are currently scheduled to be upgraded to comply with the current water quality standards. But these new ammonia standards may require a different treatment technology than the one being considered by the permittee. It is important that permittees discuss any new and upcoming requirements with their consulting engineers to ensure that their treatment systems are capable of complying with the new requirements. The Department encourages permittees to construct treatment technologies that can attain effluent quality that supports the EPA ammonia criteria.

Ammonia toxicity varies by temperature and by pH of the water. Assuming a stable pH value, but taking into account winter and summer temperatures, Missouri includes two seasons of ammonia effluent limitations.

#### **Outfall #001:**

Current effluent limitations in this permit for summer are – 6.1 mg/L daily maximum, 1.2 mg/L monthly average.

Current effluent limitations in this permit for winter are – 11.9 mg/L daily maximum, 2.2 mg/L monthly average.

Under the new EPA criteria, where mussels of the family Unionidae are present or expected to be present, the estimated effluent limitations for a facility in a location such as this that discharges to a receiving stream with the mixing consideration listed in Part IV of the Fact Sheet will be:

| Season | Temp (°C) | pH (SU) | Total Ammonia Nitrogen CCC (mg/L) | Total Ammonia Nitrogen CMC (mg/L) |
|--------|-----------|---------|-----------------------------------|-----------------------------------|
| Summer | 26        | 7.8     | 0.7                               | 3.4                               |
| Winter | 6         | 7.8     | 2.3                               | 13                                |

#### **Summer: April 1 – September 30**

$$\text{Chronic WLA: } C_e = ((9.3 + 0.25)0.7 - (0.25 * 0.01))/9.3$$

$$C_e = 0.72 \text{ mg/L}$$

$$\text{Acute WLA: } C_e = ((9.3 + 0.0025)3.4 - (0.0025 * 0.01))/9.3$$

$$C_e = 3.40 \text{ mg/L}$$

$$\text{LTA}_c = 0.72 \text{ mg/L } (0.425) = 0.31 \text{ mg/L}$$

$$[\text{CV} = 2.30, 99^{\text{th}} \text{ Percentile, 30 day avg.}]$$

$$\text{LTA}_a = 3.40 \text{ mg/L } (0.107) = 0.36 \text{ mg/L}$$

$$[\text{CV} = 2.30, 99^{\text{th}} \text{ Percentile}]$$

Use most protective number of  $\text{LTA}_c$  or  $\text{LTA}_a$ .

$$\text{MDL} = 0.31 \text{ mg/L } (9.34) = 2.9 \text{ mg/L}$$

$$[\text{CV} = 2.30, 99^{\text{th}} \text{ Percentile}]$$

$$\text{AML} = 0.31 \text{ mg/L } (1.79) = 0.5 \text{ mg/L}$$

$$[\text{CV} = 2.30, 95^{\text{th}} \text{ Percentile, } n = 30]$$

#### **Winter: October 1 – March 31**

$$\text{Chronic WLA: } C_e = ((9.3 + 0.25)2.3 - (0.25 * 0.01))/9.3$$

$$C_e = 2.36 \text{ mg/L}$$

$$\text{Acute WLA: } C_e = ((9.3 + 0.0025)13 - (0.0025 * 0.01))/9.3$$

$$C_e = 13.00 \text{ mg/L}$$

$$\text{LTA}_c = 2.36 \text{ mg/L } (0.345) = 0.82 \text{ mg/L}$$

$$[\text{CV} = 3.01, 99^{\text{th}} \text{ Percentile, 30 day avg.}]$$

$$\text{LTA}_a = 13.00 \text{ mg/L } (0.093) = 1.20 \text{ mg/L}$$

$$[\text{CV} = 3.01, 99^{\text{th}} \text{ Percentile}]$$

Use most protective number of  $\text{LTA}_c$  or  $\text{LTA}_a$ .

$$\text{MDL} = 0.82 \text{ mg/L (10.80)} = 8.8 \text{ mg/L}$$

$$\text{AML} = 0.82 \text{ mg/L (2.04)} = 1.7 \text{ mg/L}$$

$$[\text{CV} = 3.01, 99^{\text{th}} \text{ Percentile}]$$

$$[\text{CV} = 3.01, 95^{\text{th}} \text{ Percentile, } n = 30]$$

Summer – 2.9 mg/L daily maximum, 0.5 mg/L monthly average.

Winter – 8.8 mg/L daily maximum, 1.7 mg/L monthly average.

#### **Outfall #002 & Internal Monitoring Point #IP2:**

Current effluent limitations in this permit for summer are – 3.6 mg/L daily maximum, 1.4 mg/L monthly average.

Current effluent limitations in this permit for winter are – 7.5 mg/L daily maximum, 2.9 mg/L monthly average.

Under the new EPA criteria, where mussels of the family Unionidae are present or expected to be present, the estimated effluent limitations for a facility in a location such as this that discharges to a receiving stream with no mixing will be:

| Season | Temp (°C) | pH (SU) | Total Ammonia Nitrogen CCC (mg/L) | Total Ammonia Nitrogen CMC (mg/L) |
|--------|-----------|---------|-----------------------------------|-----------------------------------|
| Summer | 26        | 7.8     | 0.7                               | 3.4                               |
| Winter | 6         | 7.8     | 2.3                               | 13                                |

#### **Summer: April 1 – September 30**

Chronic WLA:  $C_e = ((4.65 + 0.0)0.7 - (0.0 * 0.01))/4.65$   
 $C_e = 0.70 \text{ mg/L}$

Acute WLA:  $C_e = ((4.65 + 0.0)3.4 - (0.0 * 0.01))/4.65$   
 $C_e = 3.40 \text{ mg/L}$

$$\text{LTA}_c = 0.70 \text{ mg/L (0.780)} = 0.55 \text{ mg/L}$$

$$\text{LTA}_a = 3.40 \text{ mg/L (0.321)} = 1.09 \text{ mg/L}$$

$$[\text{CV} = 0.6, 99^{\text{th}} \text{ Percentile, 30 day avg.}]$$

$$[\text{CV} = 0.6, 99^{\text{th}} \text{ Percentile}]$$

Use most protective number of  $\text{LTA}_c$  or  $\text{LTA}_a$ .

$$\text{MDL} = 0.55 \text{ mg/L (3.11)} = 1.7 \text{ mg/L}$$

$$\text{AML} = 0.55 \text{ mg/L (1.19)} = 0.6 \text{ mg/L}$$

$$[\text{CV} = 0.6, 99^{\text{th}} \text{ Percentile}]$$

$$[\text{CV} = 0.6, 95^{\text{th}} \text{ Percentile, } n = 30]$$

#### **Winter: October 1 – March 31**

Chronic WLA:  $C_e = ((4.65 + 0.0)2.3 - (0.0 * 0.01))/4.65$   
 $C_e = 2.30 \text{ mg/L}$

Acute WLA:  $C_e = ((4.65 + 0.0)13 - (0.0 * 0.01))/4.65$   
 $C_e = 13.00 \text{ mg/L}$

$$\text{LTA}_c = 2.30 \text{ mg/L (0.780)} = 1.79 \text{ mg/L}$$

$$\text{LTA}_a = 13.00 \text{ mg/L (0.321)} = 4.17 \text{ mg/L}$$

$$[\text{CV} = 0.6, 99^{\text{th}} \text{ Percentile, 30 day avg.}]$$

$$[\text{CV} = 0.6, 99^{\text{th}} \text{ Percentile}]$$

Use most protective number of  $\text{LTA}_c$  or  $\text{LTA}_a$ .

$$\text{MDL} = 1.79 \text{ mg/L (3.11)} = 5.6 \text{ mg/L}$$

$$\text{AML} = 1.79 \text{ mg/L (1.19)} = 2.1 \text{ mg/L}$$

$$[\text{CV} = 0.6, 99^{\text{th}} \text{ Percentile}]$$

$$[\text{CV} = 0.6, 95^{\text{th}} \text{ Percentile, } n = 30]$$

Summer – 1.7 mg/L daily maximum, 0.6 mg/L monthly average.

Winter – 5.6 mg/L daily maximum, 2.1 mg/L monthly average.

These estimated limits above are based in part on the actual performance of the plant at the time of the drafting of this permit and should not be construed as future effluent limitations. Future effluent limits, based on the EPA's 2013 water quality criteria for ammonia, will depend in part on the actual performance of the facility at the time the permit is renewed.

Operating permits for facilities in Missouri must be written based on current statutes and regulations. Therefore permits will be written with the existing effluent limitations until the new standards are adopted. To aid permittees in decision making, an advisory will be added to permit Fact Sheets notifying permittees of the expected effluent limitations for ammonia. When setting schedules of compliance for ammonia effluent limitations, consideration will be given to facilities that have recently constructed upgraded facilities to meet the current ammonia limitations.

For more information on this topic feel free to contact the Missouri Department of Natural Resources, Water Protection Program, Water Pollution Control Branch, Operating Permits Section at (573) 751-1300.

## Part VII – Effluent Limits Determination

Effluent limitations derived and established in the below Effluent Limitations Table are based on current operations of the facility. Future permit action due to facility modification may contain new operating permit terms and conditions that supersede the terms and conditions, including effluent limitations, of this operating permit.

### OUTFALL #001 – MAIN FACILITY OUTFALL AT NEOSHO SHOAL CREEK WWTP

#### APPLICABLE DESIGNATIONS OF WATERS OF THE STATE:

As per Missouri's Effluent Regulations [10 CSR 20-7.015], the waters of the state are divided into the below listed seven (7) categories. Each category lists effluent limitations for specific parameters, which are presented in each outfall's Effluent Limitation Table and further discussed in the Derivation & Discussion of Limits section. For this permitted feature, please see; All Other Waters [10 CSR 20-7.015(8)].

#### EFFLUENT LIMITATIONS TABLE:

| PARAMETER                         | Unit    | Basis for Limits | Daily Maximum | Weekly Average | Monthly Average | Previous Permit Limit | Sampling Frequency | Reporting Frequency | Sample Type **** |
|-----------------------------------|---------|------------------|---------------|----------------|-----------------|-----------------------|--------------------|---------------------|------------------|
| Flow                              | MGD     | 1                | *             |                | _*              | _*/*                  | _1/day             | _monthly            | _T               |
| Ammonia as N (Apr 1 – Sep 30)     | mg/L    | 2, 3             | 6.1           |                | _1.2            | _*/*                  | _2/month           | monthly             | _G               |
| Ammonia as N (Oct 1 – Mar 31)     | mg/L    | 2, 3             | 11.9          |                | _2.2            | _*/*                  | _2/month           | monthly             | _G               |
| <i>Escherichia coli</i> **        | #/100mL | 1, 3             |               | 630            | 126             | _630/126              | _1/week            | monthly             | _G               |
| PARAMETER                         | Unit    | Basis for Limits | Minimum       |                | Maximum         | Previous Permit Limit | Sampling Frequency | Reporting Frequency | Sample Type      |
| pH                                | SU      | 1                | _6.0          |                | _9.0            | 6.5-9.0               | _1/week            | monthly             | G                |
| PARAMETER                         | Unit    | Basis for Limits | Daily Maximum |                | Monthly Average | Previous Permit Limit | Sampling Frequency | Reporting Frequency | Sample Type **** |

| 3. Water Quality Based Effluent Limits   | 6. Water Quality Model    | 9. WET Test Policy                |                                  |

**OUTFALL #001 – MAIN FACILITY OUTFALL AT NEOSHO SHOAL CREEK WWTP – DERIVATION AND DISCUSSION OF LIMITS:**

- **Flow.** In accordance with [40 CFR Part 122.44(i)(1)(ii)] the volume of effluent discharged from each outfall is needed to assure compliance with permitted effluent limitations. If the permittee is unable to obtain effluent flow, then it is the responsibility of the permittee to inform the Department, which may require the submittal of an operating permit modification.
- **Total Ammonia Nitrogen.** Early Life Stages Present Total Ammonia Nitrogen criteria apply [10 CSR 20-7.031(5)(B)7.C. & Table B3]. Background total ammonia nitrogen = 0.01 mg/L.

| Season | Temp (°C) | pH (SU) | Total Ammonia Nitrogen<br>CCC (mg/L) | Total Ammonia Nitrogen<br>CMC (mg/L) |
|--------|-----------|---------|--------------------------------------|--------------------------------------|
| Summer | 26        | 7.8     | 1.5                                  | 12.1                                 |
| Winter | 6         | 7.8     | 3.1                                  | 12.1                                 |

**Summer: April 1 – September 30**

Chronic WLA:  $C_e = ((9.3 + 0.25)1.5 - (0.25 * 0.01))/9.3$   
 $C_e = 1.54 \text{ mg/L}$

Acute WLA:  $C_e = ((9.3 + 0.0025)12.1 - (0.0025 * 0.01))/9.3$   
 $C_e = 12.10 \text{ mg/L}$

$LTA_c = 1.54 \text{ mg/L} (0.425) = 0.65 \text{ mg/L}$   
 $LTA_a = 12.10 \text{ mg/L} (0.107) = 1.30 \text{ mg/L}$

[CV = 2.30, 99<sup>th</sup> Percentile, 30 day avg.]  
[CV = 2.30, 99<sup>th</sup> Percentile]

Use most protective number of  $LTA_c$  or  $LTA_a$ .

MDL =  $0.65 \text{ mg/L} (9.34) = 6.1 \text{ mg/L}$   
AML =  $0.65 \text{ mg/L} (1.79) = 1.2 \text{ mg/L}$

[CV = 2.30, 99<sup>th</sup> Percentile]  
[CV = 2.30, 95<sup>th</sup> Percentile, n =30]

**Winter: October 1 – March 31**

Chronic WLA:  $C_e = ((9.3 + 0.25)3.1 - (0.25 * 0.01))/9.3$   
 $C_e = 3.18 \text{ mg/L}$

Acute WLA:  $C_e = ((9.3 + 0.0025)12.1 - (0.0025 * 0.01))/9.3$   
 $C_e = 12.10 \text{ mg/L}$

$LTA_c = 3.18 \text{ mg/L} (0.345) = 1.10 \text{ mg/L}$   
 $LTA_a = 12.10 \text{ mg/L} (0.093) = 1.12 \text{ mg/L}$

[CV = 3.12, 99<sup>th</sup> Percentile, 30 day avg.]  
[CV = 3.12, 99<sup>th</sup> Percentile]

Use most protective number of  $LTA_c$  or  $LTA_a$ .

MDL =  $1.10 \text{ mg/L} (10.80) = 11.9 \text{ mg/L}$   
AML =  $1.10 \text{ mg/L} (2.04) = 2.2 \text{ mg/L}$

[CV = 3.12, 99<sup>th</sup> Percentile]  
[CV = 3.12, 95<sup>th</sup> Percentile, n =30]

- **Escherichia coli (E. coli).** Monthly average of 126 per 100 mL as a geometric mean and weekly average of 630 per 100 mL as a geometric mean during the recreational season (April 1 – October 31), to protect Whole Body Contact Recreation (A) designated use of the receiving stream, as per 10 CSR 20-7.031(5)(C). An effluent limit for both monthly average and weekly average is required by 40 CFR 122.45(d). The Geometric Mean is calculated by multiplying all of the data points and then taking the nth root of this product, where n = # of samples collected. For example: Five *E. coli* samples were collected with results of 1, 4, 6, 10, and 5 (#/100mL). Geometric Mean = 5<sup>th</sup> root of (1)(4)(6)(10)(5) = 5<sup>th</sup> root of 1,200 = 4.1 #/100mL.
- **pH.** 6.0-9.0 SU. pH limitations [10 CSR 20-7.015] are protective of the water quality standard [10 CSR 20-7.031(5)(E)], due to the buffering capacity of the mixing zone.
- **Oil & Grease.** Effluent limitations of 15 mg/L as a daily maximum and 10 mg/L as a monthly average have been retained from the previous permit. Oil & grease is a conventional pollutant, and effluent limitation will ensure the protection of aquatic life.
- **Total Nitrogen and Total Phosphorus.** Monitoring for total nitrogen and total phosphorus is required for facilities that have a design flow greater than 100,000 gpd per 10 CSR 20-7.015(9)(D)7. Total nitrogen shall be determined by testing for Total Kjeldahl Nitrogen (TKN) and nitrate + nitrite and reporting the sum of the results (reported as N). Nitrate + nitrite can be analyzed together or separately.

- **Phenol.** Protection of Aquatic Life Chronic Criteria = 2,560 µg/L, Acute Criteria = 10,200 µg/L.

Chronic WLA:  $C_e = ((9.3 + 0.25)2,560 - (0.25 * 0.0))/9.3$   
 $C_e = 2,566.9 \text{ µg/L}$

Acute WLA:  $C_e = ((9.3 + 0.0025)10,200 - (0.0025 * 0.0))/9.3$   
 $C_e = 10,202.7 \text{ µg/L}$

$LTA_c = 2,566.9 (0.165) = 424.12 \text{ µg/L}$  [CV = 2.54, 99<sup>th</sup> Percentile]  
 $LTA_a = 10,202.7 (0.101) = 1,030.3 \text{ µg/L}$  [CV = 2.54, 99<sup>th</sup> Percentile]

Use most protective number of  $LTA_c$  or  $LTA_a$ .

MDL = 424.12 (9.90) = 4,200.5 µg/L [CV = 2.54, 99<sup>th</sup> Percentile]  
 AML = 424.12 (3.10) = 1,316.3 µg/L [CV = 2.54, 95<sup>th</sup> Percentile, n = 4]

### **Metals**

Effluent limitations for total recoverable metals were developed using methods and procedures outlined in the “Technical Support Document for Water Quality-based Toxic Controls” (EPA/505/2-90-001) and “The Metals Translator: Guidance For Calculating a Total Recoverable Permit Limit from a Dissolved Criterion” (EPA 823-B-96-007). General warm-water fishery criteria apply and a water hardness of 162 mg/L is used in the conversion below.

Due to the absence of contemporaneous effluent and instream data for total recoverable metals, dissolved metals, hardness, and total suspended solids with which to calculate metals translators, partitioning between the dissolved and absorbed phases was assumed to be minimal (Section 5.7.3, EPA/505/2-90-001). Freshwater criteria conversion factors for dissolved metals were used as the metals translator as recommended in guidance (Section 1.3, 1.5.3, and Table 1, EPA 823-B-96-007). If concurrent site-specific data for total recoverable metals, dissolved metals, hardness, and total suspended solids are provided to the Department, partitioning evaluations may be considered and site-specific translators developed.

| METAL        | CONVERSION FACTORS |         |
|--------------|--------------------|---------|
|              | ACUTE              | CHRONIC |
| Cadmium      | 0.924              | 0.889   |
| Chromium III | 0.316              | 0.860   |
| Chromium VI  | N/A                | N/A     |
| Copper       | 0.960              | 0.960   |
| Iron         | N/A                | N/A     |

| METAL    | CONVERSION FACTORS |         |
|----------|--------------------|---------|
|          | ACUTE              | CHRONIC |
| Lead     | 0.721              | 0.721   |
| Mercury  | 0.85               | N/A     |
| Nickel   | 0.998              | 0.997   |
| Selenium | N/A                | N/A     |
| Zinc     | 0.978              | 0.986   |

Conversion factors for Cd and Pb are hardness dependent. Values calculated using equation found in Section 1.3 of EPA 823-B-96-007 and hardness = 162 mg/L.

- **Cadmium, Total Recoverable.** Protection of Aquatic Life Chronic Criteria = 0.3 µg/L, Acute Criteria = 7.6 µg/L.

Chronic =  $0.3/0.889 = 0.39 \text{ µg/L}$   
 Acute =  $7.6/0.924 = 8.23 \text{ µg/L}$

Chronic WLA:  $C_e = ((9.3 + 0.25)0.39 - (0.25 * 0.0))/9.3$   
 $C_e = 0.4 \text{ µg/L}$

Acute WLA:  $C_e = ((9.3 + 0.0025)8.23 - (0.0025 * 0.0))/9.3$   
 $C_e = 8.23 \text{ µg/L}$

$LTA_c = 0.4 (0.597) = 0.23 \text{ µg/L}$  [CV = 0.47, 99<sup>th</sup> Percentile]  
 $LTA_a = 8.23 (0.389) = 3.2 \text{ µg/L}$  [CV = 0.47, 99<sup>th</sup> Percentile]

Use most protective number of  $LTA_c$  or  $LTA_a$ .

MDL = 0.23 (2.57) = 0.6 µg/L [CV = 0.47, 99<sup>th</sup> Percentile]  
 AML = 0.23 (1.43) = 0.3 µg/L [CV = 0.47, 95<sup>th</sup> Percentile, n = 4]

- **Chromium (III), Total Recoverable.** The previous permit included final effluent limitations of 976.2 µg/L as a daily maximum and 389.3 µg/L as a monthly average. Over the previous five years, the permittee has reported non-detects which are less than the water quality standards. It has been determined by the permit writer that at this time no reasonable potential exists for this facility to exceed water quality criteria therefore, monitoring only requirements are included in this permit. Upon renewal, data collected will be reviewed to conduct a reasonable potential analysis in order to reevaluate this determination.
- **Chromium (VI), Dissolved.** The previous permit included final effluent limitations of 20.3 µg/L as a daily maximum and 8.1 µg/L as a monthly average. As a result of a reasonable potential analysis, it has been determined that there is no reasonable potential to violate water quality standards. Therefore, it has been determined by the permit writer that monitoring only requirements be included in this permit. Upon renewal, data collected will be reviewed to conduct a reasonable potential analysis in order to reevaluate this determination.
- **Copper, Total Recoverable.** Monitoring only requirements have been retained from the previous permit. As a result of a reasonable potential analysis, it has been determined that there is no reasonable potential to violate water quality standards. Therefore, it has been determined by the permit writer that monitoring only requirements be included in this permit. Upon renewal, data collected will be reviewed to conduct a reasonable potential analysis in order to reevaluate this determination.
- **Iron, Total Recoverable.** Protection of Aquatic Life Chronic Criteria = 1,000 µg/L.

$$\text{Chronic WLA: } C_e = ((9.3 + 0.25)1,000 - (0.25 * 0.0))/9.3$$

$$C_e = 1,002.69 \text{ µg/L}$$

$$\text{LTA}_c = 1,002.69 (0.340) = 340.92 \text{ µg/L} \quad [\text{CV} = 1.12, 99^{\text{th}} \text{ Percentile}]$$

$$\text{MDL} = 340.92 (5.43) = 1,849.6 \text{ µg/L} \quad [\text{CV} = 1.12, 99^{\text{th}} \text{ Percentile}]$$

$$\text{AML} = 340.92 (2.06) = 702.5 \text{ µg/L} \quad [\text{CV} = 1.12, 95^{\text{th}} \text{ Percentile, } n = 4]$$

- **Lead, Total Recoverable.** Monitoring only requirements have been retained from the previous permit. As a result of a reasonable potential analysis, it has been determined that there is no reasonable potential to violate water quality standards. Therefore, it has been determined by the permit writer that monitoring only requirements be included in this permit. Upon renewal, data collected will be reviewed to conduct a reasonable potential analysis in order to reevaluate this determination.
- **Mercury, Total Recoverable.** Monitoring only requirements have been retained from the previous permit. As a result of a reasonable potential analysis, it has been determined that there is no reasonable potential to violate water quality standards. Therefore, it has been determined by the permit writer that monitoring only requirements be included in this permit. Upon renewal, data collected will be reviewed to conduct a reasonable potential analysis in order to reevaluate this determination.
- **Nickel, Total Recoverable.** Monitoring only requirements have been retained from the previous permit. As a result of a reasonable potential analysis, it has been determined that there is no reasonable potential to violate water quality standards. Therefore, it has been determined by the permit writer that monitoring only requirements be included in this permit. Upon renewal, data collected will be reviewed to conduct a reasonable potential analysis in order to reevaluate this determination.
- **Selenium, Total Recoverable.** Protection of Aquatic Life Chronic Criteria = 5 µg/L.

$$\text{Chronic WLA: } C_e = ((9.3 + 0.25)5 - (0.25 * 0.0))/9.3$$

$$C_e = 5.01 \text{ µg/L}$$

$$\text{LTA}_c = 5.01 (0.259) = 1.3 \text{ µg/L} \quad [\text{CV} = 1.54, 99^{\text{th}} \text{ Percentile}]$$

$$\text{MDL} = 1.3 (7.06) = 9.2 \text{ µg/L} \quad [\text{CV} = 1.54, 99^{\text{th}} \text{ Percentile}]$$

$$\text{AML} = 1.3 (2.43) = 3.2 \text{ µg/L} \quad [\text{CV} = 1.54, 95^{\text{th}} \text{ Percentile, } n = 4]$$

- **Zinc, Total Recoverable.** Monitoring only requirements have been retained from the previous permit. As a result of a reasonable potential analysis, it has been determined that there is no reasonable potential to violate water quality standards. Therefore, it has been determined by the permit writer that monitoring only requirements be included in this permit. Upon renewal, data collected will be reviewed to conduct a reasonable potential analysis in order to reevaluate this determination.

### **Whole Effluent Toxicity**

- **Acute Whole Effluent Toxicity.** Monitoring requirement only. Monitoring is required to determine if reasonable potential exists for this facility's discharge to exceed water quality standards.

Acute and/or Chronic Allowable Effluent Concentrations (AECs) for facilities that discharge to Waters of the State lacking designated uses, Class C, Class P (with default Mixing Considerations), or Lakes [10 CSR 20-7.031(5)(A)4.B.(IV)(b)] are 100%, 50%, 25%, 12.5%, & 6.25%.

- **Chronic Whole Effluent Toxicity.** Monitoring requirement only. Monitoring is required to determine if reasonable potential exists for this facility's discharge to exceed water quality standards.

Acute and/or Chronic Allowable Effluent Concentrations (AECs) for facilities that discharge to Waters of the State lacking designated uses, Class C, Class P (with default Mixing Considerations), or Lakes [10 CSR 20-7.031(5)(A)4.B.(IV)(b)] are 100%, 50%, 25%, 12.5%, & 6.25%.

### **Sampling Frequency Justification:**

Sampling and reporting frequency was changed from once/month to once/quarter for total recoverable cadmium, total recoverable chromium (III), dissolved chromium (VI), and total recoverable selenium and from once/week to twice/month for ammonia. The reduction in sampling for all of the above listed parameters is due to the consistency of the data submitted for each parameter. This determination will be reevaluated during the next renewal. Weekly sampling is required for *E. coli*, per 10 CSR 20-7.015(9)(D)6.A.

**WET Test Sampling Frequency Justification.** WET Testing schedules and intervals are established in accordance with the Department's Permit Manual; Section 5.2 *Effluent Limits / WET Testing for Compliance Bio-monitoring*. It is recommended that WET testing be conducted during the period of lowest stream flow.

### **Acute Whole Effluent Toxicity**

- ☒ - No less than **ONCE/YEAR:**
  - ☒ -Facility is designated as a Major facility or has a design flow  $\geq 1.0$  MGD.
  - ☐ - Facility incorporates a pretreatment program and dilution of the receiving stream is 100x or greater.
  - ☐ - Facility continuously or routinely exceeds their design flow.
  - ☐ -Facility exceeds its design population equivalent (PE) for BOD<sub>5</sub> whether or not its design flow is being exceeded.
  - ☒ -Facility has Water Quality-based effluent limitations for toxic substances (other than NH<sub>3</sub>).

### **Chronic Whole Effluent Toxicity**

- ☒ -No less than **ONCE/PERMIT CYCLE:**
  - ☒ -POTW facilities with a design flow of greater than 1.0 million gallons per day, but less than 10 million gallons per day, shall conduct and submit to the Department a chronic WET test no less than once per five years.

### **Sampling Type Justification:**

As per 10 CSR 20-7.015, BOD<sub>5</sub>, TSS, and WET test samples collected for mechanical plants shall be a 24 hour composite sample. Grab samples, however, must be collected for pH, Ammonia as N, *E. coli*, Oil & Grease, and Total Phosphorus. This is due to the holding time restriction for *E. coli*, the volatility of Ammonia, and the fact that pH cannot be preserved and must be sampled in the field. As Ammonia, Oil & Grease, and Total Phosphorus samples must be immediately preserved, these samples are to be collected as a grab.

**OUTFALL #002 (DISCHARGE AT NEOSHO CROWDER WWTP)**

**APPLICABLE DESIGNATIONS OF WATERS OF THE STATE:**

For these permitted features, please see; Losing [10 CSR 20-7.015(4)]

**EFFLUENT LIMITATIONS TABLE:**

| PARAMETER        | Unit    | Basis for Limits | Daily Maximum |  | Monthly Average | Previous Permit Limit | Sampling Frequency | Reporting Frequency | Sample Type **** |
|------------------|---------|------------------|---------------|--|-----------------|-----------------------|--------------------|---------------------|------------------|
| Total Phosphorus | lbs/day | 8                | 12.51         |  |                 | ***                   | 1/day              | monthly             | G                |

\* - Monitoring requirement only.

\*\*\*\* - G = Grab

\*\*\* - Parameter not previously established in previous state operating permit.

**Basis for Limitations Codes:**

- |                                          |                           |                                   |                                  |
|------------------------------------------|---------------------------|-----------------------------------|----------------------------------|
| 1. State or Federal Regulation/Law       | 4. Antidegradation Review | 7. Best Professional Judgment     | 10. Multiple Discharger Variance |
| 2. Water Quality Standard (includes RPA) | 5. Antidegradation Policy | 8. TMDL or Permit in lieu of TMDL |                                  |
| 3. Water Quality Based Effluent Limits   | 6. Water Quality Model    | 9. WET Test Policy                |                                  |

**OUTFALL #002 – DERIVATION AND DISCUSSION OF LIMITS:**

- **Total Phosphorus.** The Neosho Crowder WWTP discharges to a stream with an EPA approved TMDL. The majority of the time, the Neosho Crowder WWTP does not discharge to the Elk River basin and was therefore not included in the TMDL calculation. During normal flows, the effluent is piped from the Neosho Crowder WWTP to the Neosho Shoal Creek WWTP before being discharged into the Shoal Creek basin. Outfall #002, however, continues to exist in the Elk River basin and may discharge under high flow conditions. The TMDL states that if the City of Neosho chooses to maintain this potential discharge to the Elk River basin, a discharge limitation of 1.5 mg/L as a daily maximum for total phosphorus will be included in the permit. The TMDL also states that the alternative would be for the City of Neosho to eliminate Outfall #002. It has been determined by the permit writer that a load-based effluent limitation is appropriate as the pollutant is total phosphorus and not a toxic pollutant. Therefore, the calculation below derives lbs/day load-based effluent limitations from the concentration based effluent limitation of 1.5 mg/L.

$$1.5 \text{ mg/L} \times 1.0 \text{ MGD} \times 8.34 \text{ lbs/gallon} = 12.51 \text{ lbs/day}$$

The actual average flow from Outfall #002 of 1.0 MGD has been used as discharges from this outfall are intermittent and dependent on the amount of flow coming to the facility. As a result of this calculation, a final effluent limitation of 12.51 lbs/day as a daily maximum has been included in this permit.

**Sampling Frequency Justification:**

Sampling frequency of once/day and reporting frequency of once/month have been established by the permit writer in order to obtain adequate data regarding the amount of total phosphorus that is being discharged during a high flow event. Absent of once/day monitoring, the department would be unable to determine compliance with the load based daily maximum effluent limitation established in the permit. This determination will be reevaluated upon renewal.

**Sampling Type Justification:**

Grab samples must be collected for total phosphorus due to the fact these samples must be immediately preserved.

**Comments:**

- **Dissolved Oxygen.** This facility adds chemicals to dechlorinate the effluent prior to discharge at Outfall #002. Dechlorination chemicals have the potential to reduce dissolved oxygen concentrations in the discharge, resulting in an anoxic discharge, unless carefully controlled. However, Outfall #002 rarely discharges and when a discharge does occur, it is due to high flow events caused by Inflow and Infiltration (I&I). Due to the receiving stream condition and the effluent condition at the time of discharges from Outfall #002, it has been determined by the permit writer that there is no reasonable potential to violate water quality standards for dissolved oxygen and therefore no monitoring requirements have been included in this permit.
- **Whole Effluent Toxicity (WET) test.** The previous permit included requirements to conduct an Acute WET test once every year at the Neosho Crowder WWTP (Outfall #002). However, when a discharge occurs at Outfall #002, it is due to high flow events caused by Inflow and Infiltration (I&I). These discharges have been determined to not be representative of the facility's performance by the permit writer due to dilution of the effluent. Additionally, WET testing should occur during critical low flow scenarios, which will not be the conditions of the receiving stream at the time of a discharge from Outfall #002. During normal flow conditions, the effluent from Outfall #002 is sent to the Neosho Shoal Creek WWTP (Outfall #001) where the effluents combine prior to sample collection for WET test purposes. This means that when the permittee collects a sample at Outfall #001 for WET test requirements, effluent from the Neosho Crowder WWTP, which is representative of normal flow conditions, will be included in the sample for compliance with WET test requirements of Outfall #001. Therefore, it has been determined by the permit writer that WET testing requirements be removed for Outfall #002 in this permit.

**OUTFALL #002 & INTERNAL MONITORING POINT #IP2**

**APPLICABLE DESIGNATIONS OF WATERS OF THE STATE:**

For these permitted features, please see; Losing [10 CSR 20-7.015(4)]

**EFFLUENT LIMITATIONS TABLE:**

| PARAMETER                         | Unit    | Basis for Limits | Daily Maximum | Weekly Average | Monthly Average | Previous Permit Limit | Sampling Frequency | Reporting Frequency | Sample Type **** |

**OUTFALL #002 (DISCHARGE AT NEOSHO CROWDER WWTP) & INTERNAL MONITORING POINT #IP2 (EFFLUENT MONITORING LOCATION FOR NEOSHO CROWDER WWTP – GOLF COURSE IRRIGATION STORAGE PONDS) – DERIVATION AND DISCUSSION OF LIMITS:**

- **Flow**. In accordance with [40 CFR Part 122.44(i)(1)(ii)] the volume of effluent discharged from each outfall is needed to assure compliance with permitted effluent limitations. If the permittee is unable to obtain effluent flow, then it is the responsibility of the permittee to inform the Department, which may require the submittal of an operating permit modification.
- **Biochemical Oxygen Demand (BOD<sub>5</sub>)**. Effluent limitations of 15 mg/L as a weekly average and 10 mg/L as a monthly average, as per [10 CSR 20-7.015] have been retained from previous state operating permit. Please see the **APPLICABLE DESIGNATION OF WATERS OF THE STATE** sub-section of the **Effluent Limits Determination**.
- **Total Suspended Solids (TSS)**. Effluent limitations of 20 mg/L as a weekly average and 15 mg/L as a monthly average, as per [10 CSR 20-7.015] have been retained from previous state operating permit. Please see the **APPLICABLE DESIGNATION OF WATERS OF THE STATE** sub-section of the **Effluent Limits Determination**.
- **Total Ammonia Nitrogen**. Early Life Stages Present Total Ammonia Nitrogen criteria apply [10 CSR 20-7.031(5)(B)7.C. & Table B3]. Background total ammonia nitrogen = 0.01 mg/L. No mixing considerations allowed; therefore, WLA = appropriate criterion.

[CV = 0.6, 95<sup>th</sup> Percentile, n = 30]

- **Escherichia coli (E. coli)**. Discharges to losing streams shall not exceed 126 per 100 mL as a Daily Maximum at any time, as per 10 CSR 20-7.031(5)(C). Monitoring only for a monthly average. No more than 10% of samples over the course of the calendar year shall exceed 126 #/100 mL daily maximum as per 10 CSR 20-7.015(9)(B)1.G.

- **Total Residual Chlorine (TRC).** Warm-water Protection of Aquatic Life CCC = 10 µg/L, CMC = 19 µg/L [10 CSR 20-7.031, Table A]. Background TRC = 0.0 µg/L.

Chronic WLA:  $C_e = ((4.65 + 0.0)10 - (0.0 * 0.0))/4.65$   
 $C_e = 10 \text{ µg/L}$

Acute WLA:  $C_e = ((4.65 + 0.0)19 - (0.0 * 0.0))/4.65$   
 $C_e = 19 \text{ µg/L}$

$LTA_c = 10 (0.527) = 5.3 \text{ µg/L}$  [CV = 0.6, 99<sup>th</sup> Percentile]  
 $LTA_a = 19 (0.321) = 6.1 \text{ µg/L}$  [CV = 0.6, 99<sup>th</sup> Percentile]

Use most protective number of  $LTA_c$  or  $LTA_a$ .

$MDL = 5.3 (3.11) = 17 \text{ µg/L}$  [CV = 0.6, 99<sup>th</sup> Percentile]  
 $AML = 5.3 (1.55) = 8 \text{ µg/L}$  [CV = 0.6, 95<sup>th</sup> Percentile, n = 4]

The Water Quality Based Effluent Limit for Total Residual Chlorine was calculated to be 17 µg/L (daily maximum limit) and 8 µg/L (monthly average limit). These limits are below the minimum quantification level (ML) of the most common and practical EPA approved CLTRC methods. The Department has determined the current acceptable ML for total residual chlorine to be 130 µg/L when using the DPD Colorimetric Method #4500 – CL G. from Standard Methods for the Examination of Waters and Wastewater. The permittee will conduct analyses in accordance with this method, or equivalent, and report actual analytical values. Measured values greater than or equal to the minimum quantification level of 130 µg/L will be considered violations of the permit and values less than the minimum quantification level of 130 µg/L will be considered to be in compliance with the permit limitation.

- **Nitrates as N.** The previous permit included final effluent limitations of 20 mg/L as a daily maximum and 10 mg/L as a monthly average in order to protect both groundwater and drinking water. After review of discharge monitoring reports over the previous five years, the permit writer made a reasonable potential determination that there is no reasonable potential to exceed the water quality standard for nitrates at this time. However, monitoring only requirements have been included in the permit in order to verify this determination. Data collected will be reviewed upon renewal to determine if an effluent limitation is necessary to protect water quality.
- **pH.** 6.5-9.0 SU. pH limitations of 6.0-9.0 SU [10 CSR 20-7.015] are not protective of the in-stream Water Quality Standard, which states that water contaminants shall not cause pH to be outside the range of 6.5-9.0 SU. No mixing zone is allowed due to the classification of the receiving stream, therefore the water quality standard must be met at the outfall.
- **Total Hardness.** The previous permit included monitoring only requirements, which have been retained in this permit. Due to the fact that the receiving stream is designated as losing and is effluent dominated, it has been determined by the permit writer that monitoring of the effluent for total hardness as opposed to monitoring in the receiving stream is appropriate and representative. Data collected will be used to establish a site-specific hardness value which may be used in effluent limitations derivation calculations for hardness dependent metals.
- **Oil & Grease.** Effluent limitations of 15 mg/L as a daily maximum and 10 mg/L as a monthly average have been retained from the previous permit. Oil & grease is a conventional pollutant, and effluent limitation will ensure the protection of aquatic life.
- **Total Nitrogen.** Monitoring for total nitrogen is required for facilities that have a design flow greater than 100,000 gpd per 10 CSR 20-7.015(9)(D)7. Total nitrogen shall be determined by testing for Total Kjeldahl Nitrogen (TKN) and nitrate + nitrite and reporting the sum of the results (reported as N). Nitrate + nitrite can be analyzed together or separately.

- **1,2-dichloroethane**. The previous permit included final effluent limitations of 10 µg/L as a daily maximum and 5 µg/L as a monthly average. Over the previous five years, due to the lack of discharge, the permit writer does not have sufficient data to make a reasonable potential determination to either replace the effluent limitations with a monitoring only requirement or to remove the parameter requirements entirely. Therefore, it has been determined by the permit writer that the effluent limitations are still appropriate. The permit writer has developed final effluent limitations following the EPA Technical Support Document for Water Quality-based Toxics Control (TSD, EPA/505/2-90-001).

Protection of Human Health Protection – Fish Consumption (HHP) Chronic Criteria = 99 µg/L, Protection of Drinking Water Supply (DWS) and Groundwater (GRW) Chronic Criteria = 5 µg/L. No mixing considerations allowed; therefore, WLA = appropriate criterion.

Chronic WLA = 5.0 µg/L

MDL = 5.0 (2.01) = 10.05 µg/L

[CV = 0.6, 99<sup>th</sup> Percentile – TSD, EPA/505/2-90-001, Table 5-3]

AML = WLA = 5.0 µg/L

[TSD, EPA/505/2-90-001, Section 5.4.4]

- **1,1,1-trichloroethane**. The previous permit included final effluent limitations of 402 µg/L as a daily maximum and 200 µg/L as a monthly average. Over the previous five years, due to the lack of discharge, the permit writer does not have sufficient data to make a reasonable potential determination to either replace the effluent limitations with a monitoring only requirement or to remove the parameter requirements entirely. Therefore, it has been determined by the permit writer that the effluent limitations are still appropriate. The permit writer has developed final effluent limitations following the EPA Technical Support Document for Water Quality-based Toxics Control (TSD, EPA/505/2-90-001).

Protection of Drinking Water Supply (DWS) and Groundwater (GRW) Chronic Criteria = 200 µg/L. No mixing considerations allowed; therefore, WLA = appropriate criterion.

Chronic WLA = 200.0 µg/L

MDL = 200.0 (2.01) = 402.0 µg/L

[CV = 0.6, 99<sup>th</sup> Percentile – TSD, EPA/505/2-90-001, Table 5-3]

AML = WLA = 200.0 µg/L

[TSD, EPA/505/2-90-001, Section 5.4.4]

- **1,1,2-trichloroethane**. The previous permit included final effluent limitations of 10 µg/L as a daily maximum and 5 µg/L as a monthly average. Over the previous five years, due to the lack of discharge, the permit writer does not have sufficient data to make a reasonable potential determination to either replace the effluent limitations with a monitoring only requirement or to remove the parameter requirements entirely. Therefore, it has been determined by the permit writer that the effluent limitations are still appropriate. The permit writer has developed final effluent limitations following the EPA Technical Support Document for Water Quality-based Toxics Control (TSD, EPA/505/2-90-001).

Protection of Human Health Protection – Fish Consumption (HHP) Chronic Criteria = 42 µg/L, Protection of Drinking Water Supply (DWS) and Groundwater (GRW) Chronic Criteria = 5 µg/L. No mixing considerations allowed; therefore, WLA = appropriate criterion.

Chronic WLA = 5.0 µg/L

MDL = 5.0 (2.01) = 10.05 µg/L

[CV = 0.6, 99<sup>th</sup> Percentile – TSD, EPA/505/2-90-001, Table 5-3]

AML = WLA = 5.0 µg/L

[TSD, EPA/505/2-90-001, Section 5.4.4]

- **Cyanide, Amenable to Chlorination.** Protection of Aquatic Life CCC = 5 µg/L, CMC = 22 µg/L, Background CN = 0 µg/L

Chronic WLA:  $C_e = ((4.65 + 0.0)5 - (0.0 * 0.0))/4.65$   
 $C_e = 5 \text{ µg/L}$

Acute WLA:  $C_e = ((4.65 + 0.0)22 - (0.0 * 0.0))/4.65$   
 $C_e = 22 \text{ µg/L}$

$LTA_c = 5 (0.527) = 2.6 \text{ µg/L}$  [CV = 0.6, 99<sup>th</sup> Percentile]  
 $LTA_a = 22 (0.321) = 7.1 \text{ µg/L}$  [CV = 0.6, 99<sup>th</sup> Percentile]

Use most protective number of  $LTA_c$  or  $LTA_a$ .

$MDL = 2.6 (3.11) = 8.2 \text{ µg/L}$  [CV = 0.6, 99<sup>th</sup> Percentile]  
 $AML = 2.6 (1.55) = 4.1 \text{ µg/L}$  [CV = 0.6, 95<sup>th</sup> Percentile, n = 4]

The Water Quality Based Effluent Limit for Cyanide amenable to chlorination was calculated to be 8.2 µg/L (daily maximum limit) and 4.1 µg/L (monthly average limit). These limits are below the minimum quantification level (ML) of the most common and practical EPA approved Cyanide amenable to chlorination methods. The Department has determined the current acceptable ML of Cyanide Amenable to Chlorination (CATC) to be 10 µg/L when using SM 4500-CN<sup>-</sup>G. Cyanides Amenable to Chlorination after Distillation in Standard Methods for the Examination of Water and Wastewater, 22<sup>nd</sup>. The permittee will conduct analyses in accordance with this method, or equivalent, and report actual analytical values. Measured values greater than or equal to the minimum quantification level of 10 µg/L will be considered violations of the permit and values less than the minimum quantification level of 10 µg/L will be considered to be in compliance with the permit limitation. The minimum quantification level does not authorize the discharge of cyanide in excess of the effluent limits stated in the permit.

- **Phenol.** The previous permit included final effluent limitations of 164 µg/L as a daily maximum and 82 µg/L as a monthly average. Over the previous five years, due to the lack of discharge, the permit writer does not have sufficient data to make a reasonable potential determination to either replace the effluent limitations with a monitoring only requirement or to remove the parameter requirements entirely. Therefore, it has been determined by the permit writer that the effluent limitations are still appropriate. The permit writer has developed final effluent limitations following the EPA Technical Support Document for Water Quality-based Toxics Control (TSD, EPA/505/2-90-001).

Protection of Aquatic Life (AQL) Chronic Criteria = 2,560 µg/L, Acute Criteria = 10,200 µg/L, Protection of Drinking Water Supply (DWS) Chronic Criteria = 100 µg/L, and Protection of Groundwater (GRW) Chronic Criteria = 300 µg/L. No mixing considerations allowed; therefore, WLA = appropriate criterion.

Chronic WLA = 100.0 µg/L

$MDL = 100.0 (2.01) = 201.0 \text{ µg/L}$  [CV = 0.6, 99<sup>th</sup> Percentile – TSD, EPA/505/2-90-001, Table 5-3]  
 $AML = WLA = 100.0 \text{ µg/L}$  [TSD, EPA/505/2-90-001, Section 5.4.4]

- **Sulfates.** The previous permit included final effluent limitations of 503 µg/L as a daily maximum and 250 µg/L as a monthly average. Over the previous five years, due to the lack of discharge, the permit writer does not have sufficient data to make a reasonable potential determination to either replace the effluent limitations with a monitoring only requirement or to remove the parameter requirements entirely. Therefore, it has been determined by the permit writer that the effluent limitations are still appropriate. The permit writer has developed final effluent limitations following the EPA Technical Support Document for Water Quality-based Toxics Control (TSD, EPA/505/2-90-001).

Protection of Drinking Water Supply (DWS) Chronic Criteria = 250 µg/L. No mixing considerations allowed; therefore, WLA = appropriate criterion.

Chronic WLA = 250.0 µg/L

$MDL = 250.0 (2.01) = 502.5 \text{ µg/L}$  [CV = 0.6, 99<sup>th</sup> Percentile – TSD, EPA/505/2-90-001, Table 5-3]  
 $AML = WLA = 250.0 \text{ µg/L}$  [TSD, EPA/505/2-90-001, Section 5.4.4]

### Metals.

Effluent limitations for total recoverable metals were developed using methods and procedures outlined in the “Technical Support Document for Water Quality-based Toxic Controls” (EPA/505/2-90-001) and “The Metals Translator: Guidance For Calculating a Total Recoverable Permit Limit from a Dissolved Criterion” (EPA 823-B-96-007). General warm-water fishery criteria apply and a water hardness of 162 mg/L is used in the conversion below.

Due to the absence of contemporaneous effluent and instream data for total recoverable metals, dissolved metals, hardness, and total suspended solids with which to calculate metals translators, partitioning between the dissolved and absorbed phases was assumed to be minimal (Section 5.7.3, EPA/505/2-90-001). Freshwater criteria conversion factors for dissolved metals were used as the metals translator as recommended in guidance (Section 1.3, 1.5.3, and Table 1, EPA 823-B-96-007). If concurrent site-specific data for total recoverable metals, dissolved metals, hardness, and total suspended solids are provided to the Department, partitioning evaluations may be considered and site-specific translators developed.

| METAL        | CONVERSION FACTORS |         |
|--------------|--------------------|---------|
|              | ACUTE              | CHRONIC |
| Boron        | N/A                | N/A     |
| Cadmium      | 0.924              | 0.889   |
| Chromium III | 0.316              | 0.860   |
| Chromium VI  | N/A                | N/A     |
| Copper       | 0.960              | 0.960   |
| Iron         | N/A                | N/A     |

| METAL    | CONVERSION FACTORS |         |
|----------|--------------------|---------|
|          | ACUTE              | CHRONIC |
| Lead     | 0.721              | 0.721   |
| Mercury  | 0.85               | N/A     |
| Nickel   | 0.998              | 0.997   |
| Selenium | N/A                | N/A     |
| Zinc     | 0.978              | 0.986   |

Conversion factors for Cd and Pb are hardness dependent. Values calculated using equation found in Section 1.3 of EPA 823-B-96-007 and hardness = 162 mg/L.

- **Boron, Total Dissolved.** The previous permit included final effluent limitations of 4,000 µg/L as a daily maximum and 2,000 µg/L as a monthly average. Over the previous five years, due to the lack of discharge, the permit writer does not have sufficient data to make a reasonable potential determination to either replace the effluent limitations with a monitoring only requirement or to remove the parameter requirements entirely. Therefore, it has been determined by the permit writer that the effluent limitations are still appropriate. The permit writer has developed final effluent limitations following the EPA Technical Support Document for Water Quality-based Toxics Control (TSD, EPA/505/2-90-001).

Protection of Irrigation (IRR) Chronic Criteria = 2,000 µg/L and Protection of Groundwater (GRW) Chronic Criteria = 2,000 µg/L. No mixing considerations allowed; therefore, WLA = appropriate criterion.

Chronic WLA = 2,000.0 µg/L

MDL = 2,000.0 (2.01) = 4,020.0 µg/L  
AML = WLA = 2,000.0 µg/L

[CV = 0.6, 99<sup>th</sup> Percentile – TSD, EPA/505/2-90-001, Table 5-3]  
[TSD, EPA/505/2-90-001, Section 5.4.4]

- **Cadmium, Total Recoverable.** Protection of Aquatic Life Chronic Criteria = 0.3 µg/L, Acute Criteria = 7.6 µg/L.

Chronic = 0.3/0.889 = 0.39 µg/L  
Acute = 7.6/0.924 = 8.23 µg/L

Chronic WLA:  $C_e = ((4.65 + 0.0)0.39 - (0.0 * 0.0))/4.65$   
 $C_e = 0.39 \mu\text{g/L}$

Acute WLA:  $C_e = ((4.65 + 0.0)8.23 - (0.0 * 0.0))/4.65$   
 $C_e = 8.23 \mu\text{g/L}$

$LTA_c = 0.39 (0.527) = 0.20 \mu\text{g/L}$  [CV = 0.6, 99<sup>th</sup> Percentile]  
 $LTA_a = 8.23 (0.321) = 2.64 \mu\text{g/L}$  [CV = 0.6, 99<sup>th</sup> Percentile]

Use most protective number of  $LTA_c$  or  $LTA_a$ .

MDL = 0.20 (3.11) = 0.6 µg/L [CV = 0.6, 99<sup>th</sup> Percentile]  
AML = 0.20 (1.55) = 0.3 µg/L [CV = 0.6, 95<sup>th</sup> Percentile, n = 4]

- **Chromium (III), Total Recoverable.** Protection of Aquatic Life Chronic Criteria = 110 µg/L, Acute Criteria = 846 µg/L.

$$\text{Chronic} = 110/0.860 = 127.96 \text{ µg/L}$$

$$\text{Acute} = 846/0.316 = 2,676.88 \text{ µg/L}$$

$$\text{Chronic WLA: } C_e = ((4.65 + 0.0)127.96 - (0.0 * 0.0))/4.65$$

$$C_e = 127.96 \text{ µg/L}$$

$$\text{Acute WLA: } C_e = ((4.65 + 0.0)2,676.88 - (0.0 * 0.0))/4.65$$

$$C_e = 2,676.88 \text{ µg/L}$$

$$\text{LTA}_c = 127.96 (0.527) = 67.49 \text{ µg/L} \quad [\text{CV} = 0.6, 99^{\text{th}} \text{ Percentile}]$$

$$\text{LTA}_a = 2,676.88 (0.321) = 859.50 \text{ µg/L} \quad [\text{CV} = 0.6, 99^{\text{th}} \text{ Percentile}]$$

Use most protective number of  $\text{LTA}_c$  or  $\text{LTA}_a$ .

$$\text{MDL} = 67.49 (3.11) = 210.2 \text{ µg/L} \quad [\text{CV} = 0.6, 99^{\text{th}} \text{ Percentile}]$$

Use most protective number of  $\text{LTA}_c$  or  $\text{LTA}_a$ .

$$\text{MDL} = 4.82 (3.11) = 15.0 \text{ µg/L} \quad [\text{CV} = 0.6, 99^{\text{th}} \text{ Percentile}]$$

$$\text{AML} = 4.82 (1.55) = 7.5 \text{ µg/L} \quad [\text{CV} = 0.6, 95^{\text{th}} \text{ Percentile, } n = 4]$$

- **Copper, Total Recoverable.** Protection of Aquatic Life Chronic Criteria = 13.5 µg/L, Acute Criteria = 21.1 µg/L.

$$\text{Chronic} = 13.5/0.960 = 14.09 \text{ µg/L}$$

$$\text{Acute} = 21.1/0.960 = 22.05 \text{ µg/L}$$

$$\text{Chronic WLA: } C_e = ((4.65 + 0.0)14.09 - (0.0 * 0.0))/4.65$$

$$C_e = 14.09 \text{ µg/L}$$

$$\text{Acute WLA: } C_e = ((4.65 + 0.0)22.05 - (0.0 * 0.0))/4.65$$

$$C_e = 22.05 \text{ µg/L}$$

$$\text{LTA}_c = 14.09 (0.527) = 7.43 \text{ µg/L} \quad [\text{CV} = 0.6, 99^{\text{th}} \text{ Percentile}]$$

$$\text{LTA}_a = 22.05 (0.321) = 7.08 \text{ µg/L} \quad [\text{CV} = 0.6, 99^{\text{th}} \text{ Percentile}]$$

Use most protective number of  $\text{LTA}_c$  or  $\text{LTA}_a$ .

$$\text{MDL} = 7.08 (3.11) = 22.0 \text{ µg/L} \quad [\text{CV} = 0.6, 99^{\text{th}} \text{ Percentile}]$$

$$\text{AML} = 7.08 (1.55) = 11.0 \text{ µg/L} \quad [\text{CV} = 0.6, 95^{\text{th}} \text{ Percentile, } n = 4]$$

- **Iron, Total Recoverable.** Monitoring only requirements have been added to this permit in order to determine if the facility has a reasonable potential to cause a violation of water quality standards in the receiving stream. Data collected will be reviewed upon renewal to determine if an effluent limitation is necessary to protect water quality. The protection of Aquatic Life Chronic Criteria = 1,000 µg/L. This is listed so the permittee may test sensitive enough to demonstrate the facility is discharging below the criteria.

- **Lead, Total Recoverable.** Protection of Aquatic Life Chronic Criteria = 4.2 µg/L, Acute Criteria = 109 µg/L.

$$\begin{aligned}\text{Chronic} &= 4.2/0.721 = 5.88 \text{ µg/L} \\ \text{Acute} &= 109/0.721 = 150.82 \text{ µg/L}\end{aligned}$$

$$\begin{aligned}\text{Chronic WLA: } C_e &= ((4.65 + 0.0)5.88 - (0.0 * 0.0))/4.65 \\ C_e &= 5.88 \text{ µg/L}\end{aligned}$$

$$\begin{aligned}\text{Acute WLA: } C_e &= ((4.65 + 0.0)150.82 - (0.0 * 0.0))/4.65 \\ C_e &= 150.82 \text{ µg/L}\end{aligned}$$

$$\begin{aligned}\text{LTA}_c &= 5.88 (0.527) = 3.10 \text{ µg/L} & [\text{CV} = 0.6, 99^{\text{th}} \text{ Percentile}] \\ \text{LTA}_a &= 150.82 (0.321) = 48.42 \text{ µg/L} & [\text{CV} = 0.6, 99^{\text{th}} \text{ Percentile}]\end{aligned}$$

Use most protective number of LTA<sub>c</sub> or LTA<sub>a</sub>.

$$\begin{aligned}\text{MDL} &= 3.10 (3.11) = 9.7 \text{ µg/L} & [\text{CV} = 0.6, 99^{\text{th}} \text{ Percentile}] \\ \text{AML} &= 3.10 (1.55) = 4.8 \text{ µg/L} & [\text{CV} = 0.6, 95^{\text{th}} \text{ Percentile, } n = 4]\end{aligned}$$

- **Mercury, Total Recoverable.** Protection of Aquatic Life Chronic Criteria = 0.5 µg/L, Acute Criteria = 2.4 µg/L.

$$\text{Acute} = 2.4/0.85 = 2.82 \text{ µg/L}$$

$$\begin{aligned}\text{Chronic WLA: } C_e &= ((4.65 + 0.0)0.5 - (0.0 * 0.0))/4.65 \\ C_e &= 0.5 \text{ µg/L}\end{aligned}$$

$$\begin{aligned}\text{Acute WLA: } C_e &= ((4.65 + 0.0)2.82 - (0.0 * 0.0))/4.65 \\ C_e &= 2.82 \text{ µg/L}\end{aligned}$$

$$\begin{aligned}\text{LTA}_c &= 0.5 (0.527) = 0.26 \text{ µg/L} & [\text{CV} = 0.6, 99^{\text{th}} \text{ Percentile}] \\ \text{LTA}_a &= 2.82 (0.321) = 0.91 \text{ µg/L} & [\text{CV} = 0.6, 99^{\text{th}} \text{ Percentile}]\end{aligned}$$

Use most protective number of LTA<sub>c</sub> or LTA<sub>a</sub>.

$$\begin{aligned}\text{MDL} &= 0.26 (3.11) = 0.8 \text{ µg/L} & [\text{CV} = 0.6, 99^{\text{th}} \text{ Percentile}] \\ \text{AML} &= 0.26 (1.55) = 0.4 \text{ µg/L} & [\text{CV} = 0.6, 95^{\text{th}} \text{ Percentile, } n = 4]\end{aligned}$$

- **Nickel, Total Recoverable.** Protection of Aquatic Life Chronic Criteria = 78.3 µg/L, Acute Criteria = 705 µg/L.

$$\begin{aligned}\text{Chronic} &= 78.3/0.997 = 78.50 \text{ µg/L} \\ \text{Acute} &= 705/0.998 = 706.10 \text{ µg/L}\end{aligned}$$

$$\begin{aligned}\text{Chronic WLA: } C_e &= ((4.65 + 0.0)78.50 - (0.0 * 0.0))/4.65 \\ C_e &= 78.50 \text{ µg/L}\end{aligned}$$

$$\begin{aligned}\text{Acute WLA: } C_e &= ((4.65 + 0.0)706.10 - (0.0 * 0.0))/4.65 \\ C_e &= 706.10 \text{ µg/L}\end{aligned}$$

$$\begin{aligned}\text{LTA}_c &= 78.50 (0.527) = 41.40 \text{ µg/L} & [\text{CV} = 0.6, 99^{\text{th}} \text{ Percentile}] \\ \text{LTA}_a &= 706.10 (0.321) = 226.72 \text{ µg/L} & [\text{CV} = 0.6, 99^{\text{th}} \text{ Percentile}]\end{aligned}$$

Use most protective number of LTA<sub>c</sub> or LTA<sub>a</sub>.

$$\begin{aligned}\text{MDL} &= 41.40 (3.11) = 128.9 \text{ µg/L} & [\text{CV} = 0.6, 99^{\text{th}} \text{ Percentile}] \\ \text{AML} &= 41.40 (1.55) = 64.3 \text{ µg/L} & [\text{CV} = 0.6, 95^{\text{th}} \text{ Percentile, } n = 4]\end{aligned}$$

- **Selenium, Total Recoverable.** Monitoring only requirements have been added to this permit in order to determine if the facility has a reasonable potential to cause a violation of water quality standards in the receiving stream. Data collected will be reviewed upon renewal to determine if an effluent limitation is necessary to protect water quality. The protection of Aquatic Life Chronic Criteria = 5 µg/L. This is listed so the permittee may test sensitive enough to demonstrate the facility is discharging below the criteria.

- **Zinc, Total Recoverable.** Protection of Aquatic Life Chronic Criteria = 176.71 µg/L, Acute Criteria = 176.71 µg/L.

Chronic =  $176.71/0.986 = 179.22 \text{ µg/L}$

Acute =  $176.71/0.978 = 180.69 \text{ µg/L}$

Chronic WLA:  $C_e = ((4.65 + 0.0)179.22 - (0.0 * 0.0))/4.65$   
 $C_e = 179.22 \text{ µg/L}$

Acute WLA:  $C_e = ((4.65 + 0.0)180.69 - (0.0 * 0.0))/4.65$   
 $C_e = 180.69 \text{ µg/L}$

$LTA_c = 179.22 (0.527) = 94.53 \text{ µg/L}$  [CV = 0.6, 99<sup>th</sup> Percentile]

$LTA_a = 180.69 (0.321) = 58.02 \text{ µg/L}$  [CV = 0.6, 99<sup>th</sup> Percentile]

Use most protective number of  $LTA_c$  or  $LTA_a$ .

MDL =  $58.02 (3.11) = 180.7 \text{ µg/L}$  [CV = 0.6, 99<sup>th</sup> Percentile]

AML =  $58.02 (1.55) = 90.1 \text{ µg/L}$  [CV = 0.6, 95<sup>th</sup> Percentile, n = 4]

#### **Sampling Frequency Justification:**

Sampling and reporting frequency was changed from once/week to twice/month for ammonia and nitrates, from once/week to once/quarter for total hardness, oil & grease, 1,2-dichloroethane, 1,1,1-trichloroethane, 1,1,2-trichloroethane, cyanide amenable to chlorination, phenol, sulfates, total dissolved boron, total recoverable cadmium, total recoverable chromium (III), dissolved chromium (VI), total recoverable copper, total recoverable lead, total recoverable mercury, total recoverable nickel, and total recoverable zinc. These changes in sampling and reporting frequency are due to the infrequency of the discharge at these locations along with the determination made by the permit writer that the effluent concentrations for the above listed parameters consistency of the discharges. This determination will be reevaluated upon renewal. Weekly sampling is required for *E. coli*, per 10 CSR 20-7.015(9)(D)6.A.

#### **Sampling Type Justification:**

As per 10 CSR 20-7.015, BOD<sub>5</sub>, TSS, and WET test samples collected for mechanical plants shall be a 24 hour composite sample. Grab samples, however, must be collected for pH, Ammonia as N, *E. coli*, TRC, Oil & Grease, and Total Phosphorus. This is due to the holding time restriction for *E. coli*, the volatility of Ammonia and TRC, and the fact that pH cannot be preserved and must be sampled in the field. As Ammonia, Oil & Grease, and Total Phosphorus samples must be immediately preserved, these samples are to be collected as a grab.

#### **Comments:**

- **Monitoring Requirements.** This permit includes both individual and combined requirements for Outfall #002 and Internal Monitoring Point #IP2, as all effluent limitations and monitoring requirements for these permitted features are identical except for total phosphorus. Outfall #002 has been granted a schedule of compliance to meet final effluent limitations for total phosphorus whereas Internal Monitoring Point #IP2 is only required to monitor for total phosphorus. In order to demonstrate this, the permit writer has created Tables A-5 and A-6 for Outfall #002 and Table A-7 for Internal Monitoring Point #IP2 as it relates to total phosphorus. All other requirements for Outfall #002 and Internal Monitoring Point #IP2 can be found on Tables A-8, A-9, and A-10. Although the two permitted features are included in Tables A-8, A-9, and A-10 together, the requirements identified in these tables apply to the two permitted features separately. This means that if a discharge occurs from both Outfall #002 and Internal Monitoring Point #IP2, the facility will be required to sample and report effluent results from both permitted feature locations. Sample results are not to be averaged between the different permitted features.
- **Expanded Effluent Testing.** It has been determined by the permit writer that expanded effluent testing requirements of the renewal application are not required for Outfall #002 or Internal Monitoring Point #IP2. Expanded effluent testing allows the permit writer to make decisions regarding potential effluent limitation or monitoring requirements, which will not be a result of this sampling at Outfall #002 or Internal Monitoring Point #IP2. Discharges from Outfall #002 historically are rare in frequency and occur during high flow events due to Inflow and Infiltration (I&I) into the collection system. As a result, samples taken from Outfall #002 would not be representative of the seasonal variation in the discharge since they will occur during the same stream and effluent conditions. Expanded effluent testing is required by the application for renewal at Outfall #001, which will include effluent from both wastewater plants and will allow for the permittee to collect samples representative of seasonal variation.

### INTERNAL MONITORING POINT #IP3 (TBEL MONITORING LOCATION FOR NEOSHO CROWDER WWTP)

#### EFFLUENT LIMITATIONS TABLE:

| PARAMETER                        | Unit | Basis for Limits | Daily Maximum           | Weekly Average | Monthly Average | Previous Permit Limit | Sampling Frequency | Reporting Frequency | Sample Type **** |

M = Measured/Calculated

#### **Basis for Limitations Codes:**

- |                                          |                           |                                   |                                  |
|------------------------------------------|---------------------------|-----------------------------------|----------------------------------|
| 1. State or Federal Regulation/Law       | 4. Antidegradation Review | 7. Best Professional Judgment     | 10. Multiple Discharger Variance |
| 2. Water Quality Standard (includes RPA) | 5. Antidegradation Policy | 8. TMDL or Permit in lieu of TMDL |                                  |
| 3. Water Quality Based Effluent Limits   | 6. Water Quality Model    | 9. WET Test Policy                |                                  |

#### INTERNAL MONITORING POINT #IP3 – DERIVATION AND DISCUSSION OF LIMITS:

- **Flow.** In accordance with [40 CFR Part 122.44(i)(1)(ii)] the volume of effluent discharged from each outfall is needed to assure compliance with permitted effluent limitations. If the permittee is unable to obtain effluent flow, then it is the responsibility of the permittee to inform the Department, which may require the submittal of an operating permit modification.
- **Biochemical Oxygen Demand (BOD<sub>5</sub>).** Technology based effluent limitations [10 CSR 20-7.015] of 65 mg/L as a weekly average and 45 mg/L as a monthly average have been included in the permit due to the fact that effluent at this location is from the Neosho Crowder WWTP, which is a trickling filter.
- **Total Suspended Solids (TSS).** Technology based effluent limitations [10 CSR 20-7.015] of 65 mg/L as a weekly average and 45 mg/L as a monthly average have been included in the permit due to the fact that effluent at this location is from the Neosho Crowder WWTP, which is a trickling filter.
- **pH.** 6.0-9.0 SU. pH limitations of 6.0-9.0 SU [10 CSR 20-7.015] are required at this location in order to demonstrate that the Neosho Crowder WWTP is meeting the requirements of 10 CSR 20-7.015 prior to the mixing of effluents from Neosho Crowder WWTP and Neosho Shoal Creek WWTP.
- **Biochemical Oxygen Demand (BOD<sub>5</sub>) Percent Removal.** In accordance with 40 CFR Part 133.102(a)(3) & (b)(3), removal efficiency is a method by which the Federal Regulations define Secondary Treatment and Equivalent to Secondary Treatment, which applies to Biochemical Oxygen Demand 5-day (BOD<sub>5</sub>) and Total Suspended Solids (TSS) for Publicly Owned Treatment Works (POTWs)/municipals. This facility is required to meet 65% removal efficiency for BOD<sub>5</sub>.
- **Total Suspended Solids (TSS) Percent Removal.** In accordance with 40 CFR Part 133.105(a)(3) & (b)(3), removal efficiency is a method by which the Federal Regulations define Secondary Treatment and Equivalent to Secondary Treatment, which applies to Biochemical Oxygen Demand 5-day (BOD<sub>5</sub>) and Total Suspended Solids (TSS) for Publicly Owned Treatment Works (POTWs)/municipals. This facility is required to meet 65% removal efficiency for TSS.

#### Sampling Frequency Justification:

Sampling and reporting frequency has been established to match the sampling frequency in the previous permit.

#### Sampling Type Justification:

As per 10 CSR 20-7.015, BOD<sub>5</sub> and TSS samples collected for mechanical plants shall be a 24 hour composite sample. Grab samples, however, must be collected for pH. This is due to the fact that pH cannot be preserved and must be sampled in the field.

**INTERNAL MONITORING POINT #IP5 (TBEL MONITORING LOCATION FOR NEOSHO SHOAL CREEK WWTP)**

**EFFLUENT LIMITATIONS TABLE:**

| PARAMETER                        | Unit | Basis for Limits | Daily Maximum           | Weekly Average | Monthly Average | Previous Permit Limit | Sampling Frequency | Reporting Frequency | Sample Type **** |
|----------------------------------|------|------------------|-------------------------|----------------|-----------------|-----------------------|--------------------|---------------------|------------------|

| 2. Water Quality Standard (includes RPA) | 5. Antidegradation Policy | 8. TMDL or Permit in lieu of TMDL |                                  |
| 3. Water Quality Based Effluent Limits   | 6. Water Quality Model    | 9. WET Test Policy                |                                  |

**INTERNAL MONITORING POINT #IP5 – DERIVATION AND DISCUSSION OF LIMITS:**

- **Flow.** In accordance with [40 CFR Part 122.44(i)(1)(ii)] the volume of effluent discharged from each outfall is needed to assure compliance with permitted effluent limitations. If the permittee is unable to obtain effluent flow, then it is the responsibility of the permittee to inform the Department, which may require the submittal of an operating permit modification.
- **Biochemical Oxygen Demand (BOD<sub>5</sub>).** Technology based effluent limitations [10 CSR 20-7.015] of 45 mg/L as a weekly average and 30 mg/L as a monthly average have been included in the permit due to the fact that effluent at this location is from the Neosho Shoal Creek WWTP.
- **Total Suspended Solids (TSS).** Technology based effluent limitations [10 CSR 20-7.015] of 45 mg/L as a weekly average and 30 mg/L as a monthly average have been included in the permit due to the fact that effluent at this location is from the Neosho Shoal Creek WWTP.
- **pH.** 6.0-9.0 SU. pH limitations of 6.0-9.0 SU [10 CSR 20-7.015] are required at this location in order to demonstrate that the Neosho Shoal Creek WWTP is meeting the requirements of 10 CSR 20-7.015 prior to the mixing of effluents from Neosho Crowder WWTP and Neosho Shoal Creek WWTP.
- **Biochemical Oxygen Demand (BOD<sub>5</sub>) Percent Removal.** In accordance with 40 CFR Part 133.102(a)(3) & (b)(3), removal efficiency is a method by which the Federal Regulations define Secondary Treatment and Equivalent to Secondary Treatment, which applies to Biochemical Oxygen Demand 5-day (BOD<sub>5</sub>) and Total Suspended Solids (TSS) for Publicly Owned Treatment Works (POTWs)/municipals. This facility is required to meet 85% removal efficiency for BOD<sub>5</sub>.
- **Total Suspended Solids (TSS) Percent Removal.** In accordance with 40 CFR Part 133.105(a)(3) & (b)(3), removal efficiency is a method by which the Federal Regulations define Secondary Treatment and Equivalent to Secondary Treatment, which applies to Biochemical Oxygen Demand 5-day (BOD<sub>5</sub>) and Total Suspended Solids (TSS) for Publicly Owned Treatment Works (POTWs)/municipals. This facility is required to meet 85% removal efficiency for TSS.

**Sampling Frequency Justification:**

Sampling and reporting frequency has been established to match the sampling frequency in the previous permit.

**Sampling Type Justification:**

As per 10 CSR 20-7.015, BOD<sub>5</sub> and TSS samples collected for mechanical plants shall be a 24 hour composite sample. Grab samples, however, must be collected for pH. This is due to the fact that pH cannot be preserved and must be sampled in the field.

**PERMITTED FEATURE #SM1 – INSTREAM MONITORING (UPSTREAM)**

**MONITORING REQUIREMENTS TABLE:**

| PARAMETER        | Unit | Basis for Limits | Daily Maximum |  | Monthly Average | Previous Permit Limit | Sampling Frequency | Reporting Frequency | Sample Type **** |
|------------------|------|------------------|---------------|--|-----------------|-----------------------|--------------------|---------------------|------------------|
| Total Nitrogen   | mg/L | 7                | *             |  | _*              | _****                 | _quarterl<br>y     | _quarterl<br>y      | _G               |
| Total Phosphorus | mg/L | 7                | *             |  | _*              | _****                 | _quarterl<br>y     | quarterly           | _G               |

\_\* - Monitoring requirement only.      \_\*\*\*\* - G = Grab  
\_\*\*\* - Parameter not previously established in previous state operating permit.

**Basis for Limitations Codes:**

- |                                          |                           |                                   |                                  |
|------------------------------------------|---------------------------|-----------------------------------|----------------------------------|
| 1. State or Federal Regulation/Law       | 4. Antidegradation Review | 7. Best Professional Judgment     | 10. Multiple Discharger Variance |
| 2. Water Quality Standard (includes RPA) | 5. Antidegradation Policy | 8. TMDL or Permit in lieu of TMDL |                                  |
| 3. Water Quality Based Effluent Limits   | 6. Water Quality Model    | 9. WET Test Policy                |                                  |

**PERMITTED FEATURE #SM1 – DERIVATION AND DISCUSSION OF MONITORING REQUIREMENTS:**

- Total Nitrogen and Total Phosphorus.** Facilities with a design flow greater than 100,000 gallons per day are required to sample their effluent quarterly for total nitrogen and total phosphorus per 10 CSR 20-7.015(9)(D)7. Upstream monitoring for these parameters is necessary to determine background stream concentrations in order to complete calculations that determine instream nutrient loading.

**Sampling Frequency Justification:**

Sampling and reporting frequency for total nitrogen and total phosphorus has been established to match the required sampling frequency of these parameters in the effluent.

**Sampling Type Justification**

As total nitrogen and total phosphorus samples must be immediately preserved; these samples are to be collected as a grab.

**PERMITTED FEATURE #SM2 – INSTREAM MONITORING (DOWNSTREAM)**

**MONITORING REQUIREMENTS TABLE:**

| PARAMETER      | Unit | Basis for Limits | Daily Maximum |  | Monthly Average | Previous Permit Limit | Sampling Frequency | Reporting Frequency | Sample Type **** |
|----------------|------|------------------|---------------|--|-----------------|-----------------------|--------------------|---------------------|------------------|
| Total Hardness | mg/L | 1, 3             | *             |  | _*              | _****                 | _quarterl<br>y     | _quarterl<br>y      | _G               |

\_\* - Monitoring requirement only.      \_\*\*\*\* - G = Grab  
\_\*\*\* - Parameter not previously established in previous state operating permit.

**Basis for Limitations Codes:**

- |                                          |                           |                                   |                                  |
|------------------------------------------|---------------------------|-----------------------------------|----------------------------------|
| 1. State or Federal Regulation/Law       | 4. Antidegradation Review | 7. Best Professional Judgment     | 10. Multiple Discharger Variance |
| 2. Water Quality Standard (includes RPA) | 5. Antidegradation Policy | 8. TMDL or Permit in lieu of TMDL |                                  |
| 3. Water Quality Based Effluent Limits   | 6. Water Quality Model    | 9. WET Test Policy                |                                  |

**PERMITTED FEATURE #SM2 – DERIVATION AND DISCUSSION OF MONITORING REQUIREMENTS:**

- Total Hardness.** Data collected will be used to establish a site-specific hardness value which may be used in effluent limitations derivation calculations for hardness dependent metals.

**Sampling Frequency Justification:**

Sampling and reporting frequency for total hardness has been established to match the required sampling frequency of the metals parameters in the effluent.

**Sampling Type Justification**

As total hardness samples must be immediately preserved; these samples are to be collected as a grab.

## **Part VIII – Cost Analysis for Compliance**

Pursuant to Section 644.145, RSMo, when issuing permits under this chapter that incorporate a new requirement for discharges from publicly owned combined or separate sanitary or storm sewer systems or publicly owned treatment works, or when enforcing provisions of this chapter or the Federal Water Pollution Control Act, 33 U.S.C. 1251 et seq., pertaining to any portion of a publicly owned combined or separate sanitary or storm sewer system or [publicly owned] treatment works, the Department of Natural Resources shall make a “finding of affordability” on the costs to be incurred and the impact of any rate changes on ratepayers upon which to base such permits and decisions, to the extent allowable under this chapter and the Federal Water Pollution Control Act. This process is completed through a cost analysis for compliance. Permits that do not include new requirements may be deemed affordable.

☒ - The Department is required to determine “findings of affordability” because the permit applies to a combined or separate sanitary sewer system for a publically-owned treatment works.

**Cost Analysis for Compliance** - The Department has made a reasonable search for empirical data indicating the permit is affordable. The search consisted of a review of Department records that might contain economic data on the community, a review of information provided by the applicant as part of the application, and public comments received in response to public notices of this draft permit. If the empirical cost data was used by the permit writer, this data may consist of median household income, any other ongoing projects that the Department has knowledge, and other demographic financial information that the community provided as contemplated by Section 644. 145.3. See **Appendix – Cost Analysis for Compliance**.

## **Part IX – Administrative Requirements**

On the basis of preliminary staff review and the application of applicable standards and regulations, the Department, as administrative agent for the Missouri Clean Water Commission, proposes to issue a permit(s) subject to certain effluent limitations, schedules, and special conditions contained herein and within the operating permit. The proposed determinations are tentative pending public comment.

### **PERMIT SYNCHRONIZATION:**

The Department of Natural Resources is currently undergoing a synchronization process for operating permits. Permits are normally issued on a five-year term, but to achieve synchronization many permits will need to be issued for less than the full five years allowed by regulation. The intent is that all permits within a watershed will move through the Watershed Based Management (WBM) cycle together will all expire in the same fiscal year. This will allow further streamlining by placing multiple permits within a smaller geographic area on public notice simultaneously, thereby reducing repeated administrative efforts. This will also allow the Department to explore a watershed based permitting effort at some point in the future. Renewal applications must continue to be submitted within 180 days of expiration, however, in instances where effluent data from the previous renewal is less than 4 years old, that data may be re-submitted to meet the requirements of the renewal application. If the permit provides a schedule of compliance for meeting new water quality based effluent limits beyond the expiration date of the permit, the time remaining in the schedule of compliance will be allotted in the renewed permit. With permit synchronization, this permit will expire in the 4<sup>th</sup> Quarter of calendar year 2017. If the department issues the permit at this time, the effective period of the permit would be less than one year in length. To ensure efficient use of department staff, reduce the department’s permitting back log and to provide better service to the permittee by avoiding another renewal application to be submitted in such a short time period this operating permit will be issued for the maximum timeframe of five years and synched with other permits in the watershed at a later date.

**PUBLIC NOTICE:**

The Department shall give public notice that a draft permit has been prepared and its issuance is pending. Additionally, public notice will be issued if a public hearing is to be held because of a significant degree of interest in and water quality concerns related to a draft permit. No public notice is required when a request for a permit modification or termination is denied; however, the requester and permittee must be notified of the denial in writing. The Department must issue public notice of a pending operating permit or of a new or reissued statewide general permit. The public comment period is the length of time not less than 30 days following the date of the public notice which interested persons may submit written comments about the proposed permit. For persons wanting to submit comments regarding this proposed operating permit, then please refer to the Public Notice page located at the front of this draft operating permit. The Public Notice page gives direction on how and where to submit appropriate comments.

☐ - The Public Notice period for this operating permit was from February 10, 2017 to March 13, 2017. No responses received.

**DATE OF FACT SHEET:** SEPTEMBER 27, 2016

**REVISED:** JANUARY 18, 2017

**COMPLETED BY:**

N/A – Not Applicable

\* - Units are (µg/L) unless otherwise noted.

\*\* - If the number of samples is 10 or greater, then the CV value must be used in the WQBEL for the applicable constituent. If the number of samples is < 10, then the default CV value must be used in the WQBEL for the applicable constituent.

\*\*\* - Coefficient of Variation (CV) is calculated by dividing the Standard Deviation of the sample set by the Mean of the same sample set.

RWC – Receiving Water Concentration. It is the concentration of a toxicant or the parameter toxicity in the receiving water after mixing (if applicable).

n – Is the number of samples.

MF – Multiplying Factor. 99% Confidence Level and 99% Probability Basis.

RP – Reasonable Potential. It is where an effluent is projected or calculated to cause an excursion above a water quality standard based on a number of factors including, as a minimum, the four factors listed in 40 CFR 122.44(d)(1)(ii).

Reasonable Potential Analysis is conducted as per (TSD, EPA/505/2-90-001, Section 3.3.2). A more detailed version including calculations of this RPA is available upon request.

**APPENDIX – COST ANALYSIS FOR COMPLIANCE:**

**Missouri Department of Natural Resources  
Water Protection Program  
Cost Analysis for Compliance  
(In accordance with RSMo 644.145)**

**Neosho Wastewater Treatment Plant, Permit Renewal  
City of Neosho  
Missouri State Operating Permit #MO-0104906**

Section 644.145 RSMo requires the Department of Natural Resources (DNR) to make a “finding of affordability” when “issuing permits under” or “enforcing provisions of” state or federal clean water laws “pertaining to any portion of a combined or separate sanitary sewer system for publicly-owned treatment works.”

This cost analysis is based on data available to the Department as provided by the permittee and data obtained from readily available sources. For the most accurate analysis, it is essential that the permittee provides the Department with current information about the City’s financial and socioeconomic situation. The financial questionnaire available to permittees on the DNR website (<http://dnr.mo.gov/forms/780-2511-f.pdf>) should have been submitted with the permit renewal application. If it was not received with the renewal application, the Department sent a request to complete it with the welcome letter. The Department currently uses software to estimate the cost for reconstruction of a treatment plant titled CAPDEWORKS (CapDet). CapDet is a preliminary design and costing software program from Hydromantis<sup>1</sup> for wastewater treatment plants that uses national indices, such as the Marshall and Swift Index and Engineering News Records Cost Index for pricing in development of capital, operating, maintenance, material, and energy costs for each treatment technology. As the program works from national indices and each community is unique in its budget commitments and treatment design, the estimated costs are expected to be higher than actual costs. The cost estimates located within this document are for the construction of a brand new treatment facility or system that is the most practical to facilitate compliance with new requirements. For the most accurate analysis, it is essential that the permittee provides the Department with current information about the City’s financial and socioeconomic situation.

The Department is required to issue a permit with final effluent limits in accordance with 644.051.1.(1) RSMo, 644.051.1.(2) RSMo, and the Clean Water Act. The table below summarizes the results of this cost analysis for the City of Neosho. The practical result of this analysis is to incorporate a long compliance schedule into the permit in order to mitigate adverse impact to distressed populations resulting from the costs of upgrading the wastewater treatment facility.

| <b>Cost Analysis for Compliance Summary Table</b>                                                  |                                                             |                                                                                                                                                  |

| <b>Estimated present worth for adding chemical addition for phosphorus removal at Outfall #002</b> | <b>Median Household Income (MHI) for the City of Neosho</b> | <b>Estimated monthly cost per user as a percent of MHI (including estimated costs per user per month for additional monitoring requirements)</b> |
| <b>\$841,000</b>                                                                                   | <b>\$36,422</b>                                             | <b>0.79%</b>                                                                                                                                     |

**Facility Description:**

This permit includes two wastewater treatment facilities which serve the City of Neosho. These facilities were previously permitted separately – Neosho Crowder WWTP (MO-0039926) and Neosho Shoal Creek WWTP (MO-0104906). During normal operations at the Neosho Crowder WWTP, effluent is sent to the Neosho Shoal Creek WWTP, where effluent from the two plants mix together prior to the ultraviolet disinfection unit at the Neosho Shoal Creek WWTP. Therefore, it has been determined by the permit writer that combining the two permits into one permit is appropriate.

**Outfall #001 – Main Facility Outfall at Neosho Shoal Creek WWTP – POTW – SIC #4952**

Flow equalization basin / bar screen / 2 oxidation ditches / 2 final clarifiers / ultraviolet disinfection / aerobic sludge digester / 2 aerated sludge holding basins / sludge is land applied.

**Outfall #002 – Discharge at Neosho Crowder WWTP (previously permitted as Outfall #001 in MO-0039926) – POTW – SIC #4952**

Flow equalization basin / bar screen / 2 pre-aeration basins / 2 primary clarifiers / 3 trickling filters / recirculation basin / 3 secondary clarifiers / chlorine disinfection / chlorine contact basin / dechlorination / 2 primary aerobic sludge digesters / sludge drying bed / sludge is land applied.

## Facility Description (continued):

### Flow evaluated for potential construction projects:

Design flow of 3.0 MGD (Neosho Crowder WWTP design flow only – Outfall #002 is the only location required to meet a total phosphorus effluent limitation).

| City of Neosho Total Number of Connections: Neosho Shoal Creek WWTP & Neosho Crowder WWTP |                            |
|-------------------------------------------------------------------------------------------|----------------------------|
| Residential Connections:                                                                  | 4,246                      |
| Commercial Connections:                                                                   | Not provided by applicant. |
| Industrial Connections:                                                                   | 132                        |

### New Permit Requirements:

The permit requires compliance at Outfall #002 with new effluent limitations for total phosphorus, which may require the design, construction and operation of different treatment technology. The cost assumptions in this cost analysis do not assume the complete replacement of the existing facility, rather that if construction does occur, it will be in addition to the current facility. To calculate the estimated user cost per 5,000 gallons, the Department used the equations currently being used in the Financial Assistance Center's rate calculator. The equations account for replacement of equipment during the life of the treatment facility, debt retirement, capital costs, and an inflation factor. The calculator evaluates multiple technologies through CapDet at a range of flows, then, using a linear interpolation, develops a spreadsheet outlining high and low costs for treatment plants. For this analysis the Department has selected the mechanical treatment technology that could be the most practical solution to meet the new requirements for the community. Because the methods used to derive the analysis estimate costs that are greater than actual costs associated with an upgrade, it reflects a conservative estimate anticipated for a community. An overestimation of costs is due to the fact that it is not possible for the permit writer to determine what existing equipment and structures will be reused in the upgraded facility before an engineer completes a facility design.

This permit also requires compliance with new monitoring requirements illustrated in the table below.

| Permitted Feature                              | New Monitoring Requirements Included in the Permit                                                                                                                                       |
|------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Outfall #001                                   | New quarterly monitoring requirements for total nitrogen and total phosphorus and new requirements to conduct a Chronic Whole Effluent Toxicity (WET) test once during the permit cycle. |
| Outfall #002                                   | New daily monitoring for total phosphorus and new quarterly monitoring requirements for total nitrogen, total recoverable iron, and total recoverable selenium.                          |
| Internal Monitoring Point #IP2                 | New quarterly monitoring requirements for total nitrogen, total phosphorus, total recoverable iron, and total recoverable selenium.                                                      |
| Internal Monitoring Point #IP4                 | Increased influent monitoring requirements for Biochemical Oxygen Demand <sub>5</sub> and Total Suspended Solids from once/quarter to once/month.                                        |
| Instream (Upstream) Monitoring Location #SM1   | New quarterly monitoring requirements for total nitrogen and total phosphorus.                                                                                                           |
| Instream (Downstream) Monitoring Location #SM2 | New quarterly monitoring requirements for total hardness.                                                                                                                                |
| Additional Requirements                        | New requirements that the permittee shall implement a Stormwater Pollution Prevention Plan (SWPPP).                                                                                      |

The size of the facility evaluated for upgrades was chosen based on the permitted design flow. If significant population growth is expected in the community, or if a significant portion of the flow is due to I&I, the flows used in the Facility Plan prepared by a consulting engineer may be different than this flow.

### Anticipated Costs Associated with Complying with the New Requirements:

#### Cost associated with chemical addition for phosphorus removal:

The total present worth to add chemical addition treatment for phosphorus removal is estimated at \$841,000 (*CAPDEWORKS cost estimator was used*). This cost, if financed through user fees, might cost each household approximately \$0.97 per month. Due to the design limitations in the CapDet cost estimator, these costs have been over estimated. It is the Department's opinion that chemical addition for phosphorus removal is the most practical treatment technology for your community based on the current design flow. A more detailed engineering and design report conducted for your specific facility will be completed by your hired engineer. This may reflect a different type of treatment option than what is described within this analysis and may include additional collection system work or additional upgrades at the treatment plant.

**Cost associated with new sampling requirements:**

| Permitted Feature                              | Total Annual Cost of New Monitoring Requirements |
|------------------------------------------------|--------------------------------------------------|
| Outfall #001                                   | \$698.00                                         |
| Outfall #002                                   | \$688.00                                         |
| Internal Monitoring Point #IP2                 | \$688.00                                         |
| Internal Monitoring Point #IP4                 | \$684.00                                         |
| Instream (Upstream) Monitoring Location #SM1   | \$388.00                                         |
| Instream (Downstream) Monitoring Location #SM2 | \$188.00                                         |
| Additional Requirements – SWPPP                | \$2,000.00                                       |
| <b>Total Annual Cost</b>                       | <b>\$5,334.00</b>                                |

The total cost estimated for new monitoring requirements is \$5,334.00 annually. This cost, if financed through user fees, might cost each household an extra \$0.10 per month. A community sets their user rates based on several factors. The percentage of the current user rate that is available to cover new debt is unknown to the Department. Therefore, the permit writer has added this additional sampling cost per user per month to the estimated resulting user cost per household per month in Table B below.

This cost analysis does not dictate that a permittee will upgrade their facility, or how they will comply with the new permit requirements. For any questions associated with the *CAPDEWORKS cost estimator*, please contact the Engineering Section at (573) 751-6621.

**(1) A community's financial capability and ability to raise or secure necessary funding;**

|                                                                                                                                                                                                                 |                                |

| Estimated additional user cost per household per month for chemical addition for phosphorus removal:                                                                               | \$0.97                                                                                                |
| Estimated additional user cost per household per month for new monitoring requirements:                                                                                            | \$0.10                                                                                                |
| Estimated resulting user cost per household per month:****                                                                                                                         | \$23.90                                                                                               |
| Estimated resulting user cost per household per month plus the amount within the current user rate used toward payments on outstanding debt:                                       | The community did not provide the Department with information regarding the current outstanding debt. |
| Median household income(MHI): <sup>2</sup>                                                                                                                                         | \$36,422                                                                                              |
| Cost per household as a percent of median household income: <sup>3</sup>                                                                                                           | 0.79%                                                                                                 |
| Estimated cost per household per month plus the amount within the current user rate used toward payments on outstanding debt as a percent of median household income: <sup>4</sup> | The community did not provide the Department with information regarding the current outstanding debt. |

CAPDET estimates the total present worth to finance the addition of chemical addition for phosphorus removal to be approximately \$841,000. If financed through user costs, the future user costs have the potential to be estimated at \$23.90 per month, which includes the estimated costs per user per month for additional monitoring requirements. These costs assume a 5% interest rate over 20 years. It is the Department's opinion that chemical addition for phosphorus removal is the most practical mechanical treatment option for the design flow of this facility.

The resulting cost per household as a percent of MHI will be used as the residential indicator in Criteria 7 below.

- \* Total Present Worth includes a five percent interest rate to construct and perform annual operation and maintenance of the new treatment plant over the term of the loan.
- \*\* Capital Cost includes project costs from CapDet with design, inspection and contingency costs.
- \*\*\* O&M cost shown in Table B includes operations, maintenance, materials, chemical and electrical costs for the facility on an annual basis. It includes items that are expected to replace during operations, such as pumps. O&M is estimated between 15% and 45% of the user cost.
- \*\*\*\* The Estimated User Cost shown in Table B is composed of the Current User Rate plus Operation & Maintenance (O&M) plus Debt Retirement Costs plus the estimated additional user cost per household per month for new monitoring requirements (\$22.83 + \$0.97 + \$0.10 = \$23.90).

**(3) An evaluation of the overall costs and environmental benefits of the control technologies;**

The investment in wastewater treatment will provide several social, environmental and economic benefits. Improved wastewater provides benefits such as avoided health costs due to water-related illness, enhanced environmental ecosystem quality, and improved natural resources. The preservation of natural resources has been proven to increase the economic value and sustainability of the surrounding communities. Maintaining Missouri's water quality standards fulfill the goals of restoring and maintaining the chemical, physical and biological integrity of the receiving stream; and, where attainable, to achieves a level of water quality that provides for the protection and propagation of fish, shellfish, wildlife and recreation in and on the water.

### **Nutrient Monitoring**

Nutrients are mineral compounds that are required for organisms to grow and thrive. Of the six (6) elemental macronutrients, Nitrogen and Phosphorus are generally not readily available and limit growth of organisms. Excess nitrogen and phosphorus will cause a shift in the ecosystem's food web. Once excess nitrogen and phosphorus are introduced into a waterbody, some species' populations will dramatically increase, while other populations will not be able to sustain life. Competition and productivity are two factors in which nutrients can alter aquatic ecosystems and the designated uses of a waterbody. For example, designated uses, such as drinking water sources and recreational uses become impaired when algal blooms take over a waterbody. These blooms can cause foul tastes and odors in the drinking water, unsightly appearance, and fish mortality in the waterbody. Some algae also produce toxins that may cause serious adverse health conditions such as liver damage, tumor promotion, paralysis, and kidney damage. The monitoring requirements for Nitrogen and Phosphorus have been added to the permit to provide data regarding the health of the receiving stream's aquatic life. A healthy ecosystem is beneficial as it provides reduced impacts on human and aquatic health as well as recreational opportunities.

### **Total Recoverable Metals**

Total recoverable metals can cause water quality issues instream. Monitoring requirements and effluent limitations will ensure the protection and propagation of fish, shellfish, wildlife and recreation in and on the water.

### **Total Hardness**

This permit contains final effluent limitations for total recoverable hardness dependent metals. Quarterly hardness monitoring will ensure the facility does not exceed water quality standards for total recoverable metals by utilizing a site-specific hardness in final effluent limitation derivations.

### **Whole Effluent Toxicity (WET) test**

The WET Test is a quantifiable method of determining if discharge from a facility may be causing toxicity to aquatic life by itself or in combination with receiving stream water. WET tests are required under 10 CSR 20-6.010(8)(A)4 to be performed by specialists properly trained in conducting the test according to 40 CFR 136. This test will help ensure that the existing permit limits are providing adequate protection for aquatic life at minimal expense to the permittee.

### **Stormwater Pollution Prevention Plan**

Stormwater runoff is water from rain or snowmelt that does not immediately infiltrate into the ground and flows over or through natural or man-made storage or conveyance systems. When undeveloped areas are converted to land uses with impervious surfaces such as buildings, parking lots, and roads, the natural hydrology of the land is altered and can result in increased surface runoff rates, volumes, and pollutant loads. Stormwater runoff picks up industrial pollutants and typically discharges them directly into nearby waterbodies or indirectly via storm sewer systems. Runoff from areas where industrial activities occur can contain toxic pollutants (e.g., heavy metals and organic chemicals) and other pollutants such as trash, debris, and oil and grease, when facility practices allow exposure of industrial materials to stormwater. This increased flow and pollutant load can impair waterbodies, degrade biological habitats, pollute drinking water sources, and cause flooding and hydrologic changes to the receiving water, such as channel erosion. Industrial facilities typically perform a portion of their activities in outdoor areas exposed to the elements. This may include activities such as material storage and handling, vehicle fueling and maintenance, shipping and receiving, and salt storage, all of which can result in pollutants being exposed to precipitation and capable of being carried off in stormwater runoff. Also, facilities may have performed industrial activities outdoors in the past and materials from those activities still remain exposed to precipitation. In addition, accidental spills and leaks, improper waste disposal, and illicit connections to storm sewers may also lead to exposure of pollutants to stormwater.

A SWPPP is a written document that identifies the industrial activities conducted at the site, including any structural control practices, which the industrial facility operator will implement to prevent pollutants from making their way into stormwater runoff. The SWPPP also must include descriptions of other relevant information, such as the physical features of the facility, and procedures for spill prevention, conducting inspections, and training of employees. The SWPPP is intended to be a "living" document, updated as necessary, such that when industrial activities or stormwater control practices are modified or replaced, the SWPPP is similarly revised to reflect these changes.

### **(4) Inclusion of ongoing costs of operating and maintaining the existing wastewater collection and treatment system, including payments on outstanding debts for wastewater collection and treatment systems when calculating projected rates:**

The community did not provide the Department with information, nor could it be found through readily available data.

- (5) **An inclusion of ways to reduce economic impacts on distressed populations in the community, including but not limited to low and fixed income populations. This requirement includes but is not limited to:**
- (a) Allowing adequate time in implementation schedules to mitigate potential adverse impacts on distressed populations resulting from the costs of the improvements and taking into consideration local community economic considerations.
  - (b) Allowing for reasonable accommodations for regulated entities when inflexible standards and fines would impose a disproportionate financial hardship in light of the environmental benefits to be gained.

**Socioeconomic Data**<sup>5-13:</sup>

| <b>Potentially Distressed Populations – City of Neosho</b> |          |
|------------------------------------------------------------|----------|
| Total Population (2015)                                    | 12,102   |
| Percent Population Growth/Decline (2000-2015)              | +15.2%   |
| 2015 MHI (in First-Half-of-2016 Dollar)                    | \$36,422 |
| Percent Change in MHI (2000-2015)                          | -15.72%  |
| Median Age (2015)                                          | 34.2     |
| Percent Change in Median Age (2000-2015)                   | -3.1%    |
| Unemployment Rate (2015)                                   | 4.3%     |
| Percent of Households in Poverty (2015)                    | 20.2%    |
| Percent of Households Receiving Food Stamps (2015)         | 19.3%    |

Opportunity for cost savings or cost avoidance:

- If available, connection to a larger centralized sewer system in the area may be more cost effective for the community.
- An opportunity may exist for the relocation of the point of discharge to a receiving stream capable of a greater mixing zone.
- The permittee may apply for State Revolving Fund (SRF) financial support in order to help fund a Capital Improvements Plan. Other loans and grants also exist for which the facility may be eligible. Contact information for the Department's Financial Assistance Center (FAC) and more information can be found on the Department's website at <http://dnr.mo.gov/env/wpp/srf/wastewater-assistance.htm>.

Opportunity for changes to implementation/compliance schedule, new technology, site specific criteria, use attainability analysis:

- The facility may propose changes to the schedule of compliance based on their own cost estimate or financial information.
- An integrated plan may be an appropriate option if they community needs to meet other environmental obligations as well as the new requirements within this permit. The integrated plan needs to be well thought out with specific timeframes built into the management plan that the municipality can reasonably commit to. The plan should be designed that will allow each municipality to meet their Clean Water Act obligations by maximizing their infrastructure improvement dollars through the appropriate sequencing of work.
- If the permittee can demonstrate that the proposed pollution controls result in substantial and widespread economic and social impact, the permittee may use Factor 6 of the Use Attainability Analysis (UAA) 40 CFR 131.10(g)(6) in the form of a variance. This process is completed by determining the treatment type with the highest attainable effluent quality that would not result in a socio-economic hardship. This process could potentially become expensive in itself.

- (6) **An assessment of other community investments and operating costs relating to environmental improvements and public health protection;**

The community did not provide the Department with information, nor could it be found through readily available data.

- (7) An assessment of factors set forth in the United States Environmental Protection Agency's guidance, including but not limited to the "Combined Sewer Overflow Guidance for Financial Capability Assessment and Schedule Development" that may ease the cost burdens of implementing wet weather control plans, including but not limited to small system considerations, the attainability of water quality standards, and the development of wet weather standards;

**Secondary indicators for consideration:**

| Indicators                                                 | Strong<br>(3 points)                        | Mid-Range<br>(2 points)            | Weak<br>(1 point)                           | Score                          |
|------------------------------------------------------------|---------------------------------------------|------------------------------------|---------------------------------------------|--------------------------------|
| Bond Rating Indicator                                      | Above BBB or Baa                            | BBB or Baa                         | Below BBB or Baa                            | Not provided by the applicant. |
| Overall Net Debt as a % of Full Market Property Value      | Below 2%                                    | 2% - 5%                            | Above 5%                                    | Not provided by the applicant. |

| Mid-Range (1.5 – 2.5)                              | <b>Low Burden<br/>(Chemical Addition for Phosphorus Removal)</b> | Medium Burden                        | High Burden          |
| Strong (above 2.5)                                 | Low Burden                                                       | Medium Burden                        | High Burden          |

Estimated Financial Burden for Chemical Addition for Phosphorus Removal:

Low Burden

The resulting financial burden has been determined by comparing the Financial Capability Indicator score (FCI) with the Residential Indicator (RI) stated in Criteria #2. The cost associated with chemical addition for phosphorus removal could result in a Low financial burden placed on the community due to the Mid-Range FCI paired with the Low RI. Please see Criteria #2 for more information on the costs specific this treatment technology.

- (8) An assessment of any other relevant local community economic condition.

The community did not report any other relevant local economic conditions.

## Conclusion and Finding

As a result of new regulations, the Department is proposing modifications to the current operating permit that may require the permittee to upgrade the facility, construct new control technologies, and to increase monitoring.

The Department considered the eight (8) criteria presented in subsection 644.145.3 when evaluating the cost associated with the relevant actions. The Department estimates the resulting monthly user costs for adding chemical addition to the existing treatment facility in order to meet new total phosphorus effluent limitations at Outfall #002 plus new and increased monitoring requirements could be \$23.90. Using this analysis, the Department finds that chemical addition for phosphorus removal is the most practical and affordable option for your community. The construction and operation of chemical addition for phosphorus removal will ensure that the individuals within the community will not be required to make unreasonable sacrifices in their essential lifestyle or spending patterns or undergo hardships in order to make the projected monthly payments for sewer connections. The Department finds that chemical addition for phosphorus removal may require user costs to be as high as 0.79% of the community's MHI (shown in Criteria #2).

In accordance with 40 CFR § 122.47(a)(1) and 10 CSR 20-7.031(11), compliance must occur as soon as possible. Therefore, based on this analysis the City of Neosho has received a five (5) year schedule of compliance for the design and construction of chemical addition for phosphorus removal. The following timeline illustrates milestones on which the five (5) year schedule of compliance should focus to maintain compliance with the permit requirements.

### Timeline 1: (not drawn to scale)

#### 5 Year Renewal

Five (5) year Schedule of Compliance

20 year Estimated Life of Facility

### Suggested milestones to meet within each year listed below:

- Year 1. Hire an engineer and conduct an evaluation of both the rate structure and the treatment plant.
- Year 2. Hold a bond election, apply for State Revolving Fund loans and/or grants, and submit a facility plan.
- Year 3. Apply for a Construction Permit and close on the loan.
- Year 4. Construction. The facility should also submit an application for renewal of the existing operating permit with new financial and socio-economic data.
- Year 5. Complete construction.

The schedule of compliance allows the community the five years to hire an engineer, evaluate operations and rate structure, obtain an engineering report, hold a bond election, close on a loan, construct the facility upgrades, and complete the project. At this time the community will know what the user rates will be based on the present worth of the chosen treatment type decided on by the community and the design engineer hired by the community. It is anticipated by the Department that rates will be increased at the end of the permit cycle to mitigate the cost of compliance of the new requirements.

The Department is committed to reassessing the cost analysis for compliance at renewal to determine if the initial schedule of compliance will accommodate the socioeconomic data and financial capability of the community at that time. In this longer time frame, the Department will work with you to explore the wastewater treatment options that make the most sense for your community. By working more closely with your community, the Department and permittees will be able to identify opportunities to extend the schedule of compliance, if appropriate. Because each community is unique, we want to make sure that you have the opportunity to consider all your options and tailor solutions to best meet your community's needs. The Department understands the economic challenges associated with achieving compliance, and is committed to using all available tools to make an accurate and practical finding of affordability for the communities in the State. If the community wishes to seek funding from the Department, please contact the Financial Assistance Center for more information. <http://www.dnr.mo.gov/env/Wpp/srf/index.html>

This determination is based on readily available data and may overestimate the financial impact on the community. The community's facility plan that is submitted as a part of the construction permit process includes a discussion of community details, what the community can afford, existing obligations, future growth potential, an evaluation of options available to the community with cost information, and a discussion on no-discharge alternatives. The cost information provided through the facility plan process, which is developed by the community and their engineer, is more comprehensive of the community's individual factors in relation to selected treatment technology and costing information.

STANDARD CONDITIONS FOR NPDES PERMITS  
ISSUED BY  
THE MISSOURI DEPARTMENT OF NATURAL RESOURCES  
MISSOURI CLEAN WATER COMMISSION  
REVISED  
AUGUST 1, 2014

These Standard Conditions incorporate permit conditions as required by 40 CFR 122.41 or other applicable state statutes or regulations. These minimum conditions apply unless superseded by requirements specified in the permit.

## Part I – General Conditions

### Section A – Sampling, Monitoring, and Recording

#### 1. Sampling Requirements.

- a. Samples and measurements taken for the purpose of monitoring shall be representative of the monitored activity.
- b. All samples shall be taken at the outfall(s) or Missouri Department of Natural Resources (Department) approved sampling location(s), and unless specified, before the effluent joins or is diluted by any other body of water or substance.

#### 2. Monitoring Requirements.

- a. Records of monitoring information shall include:
  - i. The date, exact place, and time of sampling or measurements;
  - ii. The individual(s) who performed the sampling or measurements;
  - iii. The date(s) analyses were performed;
  - iv. The individual(s) who performed the analyses;
  - v. The analytical techniques or methods used; and
  - vi. The results of such analyses.
- b. If the permittee monitors any pollutant more frequently than required by the permit at the location specified in the permit using test procedures approved under 40 CFR Part 136, or another method required for an industry-specific waste stream under 40 CFR subchapters N or O, the results of such monitoring shall be included in the calculation and reported to the Department with the discharge monitoring report data (DMR) submitted to the Department pursuant to Section B, paragraph 7.

3. **Sample and Monitoring Calculations.** Calculations for all sample and monitoring results which require averaging of measurements shall utilize an arithmetic mean unless otherwise specified in the permit.

4. **Test Procedures.** The analytical and sampling methods used shall conform to the reference methods listed in 10 CSR 20-7.015 unless alternates are approved by the Department. The facility shall use sufficiently sensitive analytical methods for detecting, identifying, and measuring the concentrations of pollutants. The facility shall ensure that the selected methods are able to quantify the presence of pollutants in a given discharge at concentrations that are low enough to determine compliance with Water Quality Standards in 10 CSR 20-7.031 or effluent limitations unless provisions in the permit allow for other alternatives. A method is “sufficiently sensitive” when; 1) the method minimum level is at or below the level of the applicable water quality criterion for the pollutant or, 2) the method minimum level is above the applicable water quality criterion, but the amount of pollutant in a facility’s discharge is high enough that the method detects and quantifies the level of pollutant in the discharge, or 3) the method has the lowest minimum level of the analytical methods approved under 10 CSR 20-7.015. These methods are also required for parameters that are listed as monitoring only, as the data collected may be used to determine if limitations need to be established. A permittee is responsible for working with their contractors to ensure that the analysis performed is sufficiently sensitive.

5. **Record Retention.** Except for records of monitoring information required by the permit related to the permittee’s sewage sludge use and disposal activities, which shall be retained for a period of at least five (5) years (or longer as required by 40 CFR part 503), the permittee shall retain records of all monitoring information, including all calibration and maintenance records and all original strip chart recordings for continuous monitoring instrumentation, copies of all reports required by the permit, and records of all data used to complete the application for the permit, for a period of at least three (3) years from the date of the sample, measurement, report or application. This period may be extended by request of the Department at any time.

#### 6. Illegal Activities.

- a. The Federal Clean Water Act provides that any person who falsifies, tampers with, or knowingly renders inaccurate any monitoring device or method required to be maintained under the permit shall, upon conviction, be punished by a fine of not more than \$10,000, or by imprisonment for not more than two (2) years, or both. If a conviction of a person is for a violation committed after a first conviction of such person under this paragraph, punishment is a fine of not more than \$20,000 per day of violation, or by imprisonment of not more than four (4) years, or both.
- b. The Missouri Clean Water Law provides that any person or who falsifies, tampers with, or knowingly renders inaccurate any monitoring device or method required to be maintained pursuant to sections 644.006 to 644.141 shall, upon conviction, be punished by a fine of not more than \$10,000, or by imprisonment for not more than six (6) months, or by both. Second and successive convictions for violation under this paragraph by any person shall be punished by a fine of not more than \$50,000 per day of violation, or by imprisonment for not more than two (2) years, or both.

### Section B – Reporting Requirements

#### 1. Planned Changes.

- a. The permittee shall give notice to the Department as soon as possible of any planned physical alterations or additions to the permitted facility when:
  - i. The alteration or addition to a permitted facility may meet one of the criteria for determining whether a facility is a new source in 40 CFR 122.29(b); or
  - ii. The alteration or addition could significantly change the nature or increase the quantity of pollutants discharged. This notification applies to pollutants which are subject neither to effluent limitations in the permit, nor to notification requirements under 40 CFR 122.42;
  - iii. The alteration or addition results in a significant change in the permittee’s sludge use or disposal practices, and such alteration, addition, or change may justify the application of permit conditions that are different from or absent in the existing permit, including notification of additional use or disposal sites not reported during the permit application process or not reported pursuant to an approved land application plan;
  - iv. Any facility expansions, production increases, or process modifications which will result in a new or substantially different discharge or sludge characteristics must be reported to the Department 60 days before the facility or process modification begins. Notification may be accomplished by application for a new permit. If the discharge does not violate effluent limitations specified in the permit, the facility is to submit a notice to the Department of the changed discharge at least 30 days before such changes. The Department may require a construction permit and/or permit modification as a result of the proposed changes at the facility.

#### 2. Non-compliance Reporting.

- a. The permittee shall report any noncompliance which may endanger health or the environment. Relevant information shall be provided orally or via the current electronic method approved by the Department, within 24 hours from the time the permittee becomes aware of the circumstances, and shall be reported to the appropriate Regional Office during normal business hours or the Environmental Emergency Response hotline at 573-634-2436 outside of normal business hours. A written submission shall also be provided within five (5) business days of the time the permittee becomes aware of the circumstances. The written submission shall contain a description of the noncompliance and its cause; the period of noncompliance, including exact dates and times, and if the noncompliance has not been corrected, the anticipated time it is expected to continue; and steps taken or planned to reduce, eliminate, and prevent reoccurrence of the noncompliance.

STANDARD CONDITIONS FOR NPDES PERMITS  
ISSUED BY  
THE MISSOURI DEPARTMENT OF NATURAL RESOURCES  
MISSOURI CLEAN WATER COMMISSION  
REVISED  
AUGUST 1, 2014

- b. The following shall be included as information which must be reported within 24 hours under this paragraph.
    - i. Any unanticipated bypass which exceeds any effluent limitation in the permit.
    - ii. Any upset which exceeds any effluent limitation in the permit.
    - iii. Violation of a maximum daily discharge limitation for any of the pollutants listed by the Department in the permit required to be reported within 24 hours.
  - c. The Department may waive the written report on a case-by-case basis for reports under paragraph 2. b. of this section if the oral report has been received within 24 hours.
3. **Anticipated Noncompliance.** The permittee shall give advance notice to the Department of any planned changes in the permitted facility or activity which may result in noncompliance with permit requirements. The notice shall be submitted to the Department 60 days prior to such changes or activity.
  4. **Compliance Schedules.** Reports of compliance or noncompliance with, or any progress reports on, interim and final requirements contained in any compliance schedule of the permit shall be submitted no later than 14 days following each schedule date. The report shall provide an explanation for the instance of noncompliance and a proposed schedule or anticipated date, for achieving compliance with the compliance schedule requirement.
  5. **Other Noncompliance.** The permittee shall report all instances of noncompliance not reported under paragraphs 2, 3, and 6 of this section, at the time monitoring reports are submitted. The reports shall contain the information listed in paragraph 2. a. of this section.
  6. **Other Information.** Where the permittee becomes aware that it failed to submit any relevant facts in a permit application, or submitted incorrect information in a permit application or in any report to the Department, it shall promptly submit such facts or information.
  7. **Discharge Monitoring Reports.**
    - a. Monitoring results shall be reported at the intervals specified in the permit.
    - b. Monitoring results must be reported to the Department via the current method approved by the Department, unless the permittee has been granted a waiver from using the method. If the permittee has been granted a waiver, the permittee must use forms provided by the Department.
    - c. Monitoring results shall be reported to the Department no later than the 28<sup>th</sup> day of the month following the end of the reporting period.
- b. Notice.
    - i. Anticipated bypass. If the permittee knows in advance of the need for a bypass, it shall submit prior notice, if possible at least 10 days before the date of the bypass.
    - ii. Unanticipated bypass. The permittee shall submit notice of an unanticipated bypass as required in Section B – Reporting Requirements, paragraph 5 (24-hour notice).
  - c. Prohibition of bypass.
    - i. Bypass is prohibited, and the Department may take enforcement action against a permittee for bypass, unless:
      1. Bypass was unavoidable to prevent loss of life, personal injury, or severe property damage;
      2. There were no feasible alternatives to the bypass, such as the use of auxiliary treatment facilities, retention of untreated wastes, or maintenance during normal periods of equipment downtime. This condition is not satisfied if adequate back-up equipment should have been installed in the exercise of reasonable engineering judgment to prevent a bypass which occurred during normal periods of equipment downtime or preventive maintenance; and
      3. The permittee submitted notices as required under paragraph 2. b. of this section.
    - ii. The Department may approve an anticipated bypass, after considering its adverse effects, if the Department determines that it will meet the three (3) conditions listed above in paragraph 2. c. i. of this section.
3. **Upset Requirements.**
    - a. Effect of an upset. An upset constitutes an affirmative defense to an action brought for noncompliance with such technology based permit effluent limitations if the requirements of paragraph 3. b. of this section are met. No determination made during administrative review of claims that noncompliance was caused by upset, and before an action for noncompliance, is final administrative action subject to judicial review.
    - b. Conditions necessary for a demonstration of upset. A permittee who wishes to establish the affirmative defense of upset shall demonstrate, through properly signed, contemporaneous operating logs, or other relevant evidence that:
      - i. An upset occurred and that the permittee can identify the cause(s) of the upset;
      - ii. The permitted facility was at the time being properly operated; and
      - iii. The permittee submitted notice of the upset as required in Section B – Reporting Requirements, paragraph 2. b. ii. (24-hour notice).
      - iv. The permittee complied with any remedial measures required under Section D – Administrative Requirements, paragraph 4.
    - c. Burden of proof. In any enforcement proceeding, the permittee seeking to establish the occurrence of an upset has the burden of proof.

## Section C – Bypass/Upset Requirements

1. **Definitions.**
  - a. *Bypass*: the intentional diversion of waste streams from any portion of a treatment facility, except in the case of blending.
  - b. *Severe Property Damage*: substantial physical damage to property, damage to the treatment facilities which causes them to become inoperable, or substantial and permanent loss of natural resources which can reasonably be expected to occur in the absence of a bypass. Severe property damage does not mean economic loss caused by delays in production.
  - c. *Upset*: an exceptional incident in which there is unintentional and temporary noncompliance with technology based permit effluent limitations because of factors beyond the reasonable control of the permittee. An upset does not include noncompliance to the extent caused by operational error, improperly designed treatment facilities, inadequate treatment facilities, lack of preventive maintenance, or careless or improper operation.
2. **Bypass Requirements.**
  - a. Bypass not exceeding limitations. The permittee may allow any bypass to occur which does not cause effluent limitations to be exceeded, but only if it also is for essential maintenance to assure efficient operation. These bypasses are not subject to the provisions of paragraphs 2. b. and 2. c. of this section.

## Section D – Administrative Requirements

1. **Duty to Comply.** The permittee must comply with all conditions of this permit. Any permit noncompliance constitutes a violation of the Missouri Clean Water Law and Federal Clean Water Act and is grounds for enforcement action; for permit termination, revocation and reissuance, or modification; or denial of a permit renewal application.
  - a. The permittee shall comply with effluent standards or prohibitions established under section 307(a) of the Federal Clean Water Act for toxic pollutants and with standards for sewage sludge use or disposal established under section 405(d) of the CWA within the time provided in the regulations that establish these standards or prohibitions or standards for sewage sludge use or disposal, even if the permit has not yet been modified to incorporate the requirement.
  - b. The Federal Clean Water Act provides that any person who violates section 301, 302, 306, 307, 308, 318 or 405 of the Act, or any permit condition or limitation implementing any such sections in a permit issued under section 402, or any requirement imposed in a pretreatment program approved under sections 402(a)(3) or 402(b)(8) of the Act, is subject to a civil penalty not to exceed \$25,000 per day for each violation. The Federal Clean Water Act provides that any person who negligently violates sections 301, 302, 306, 307, 308, 318, or 405 of the Act, or any condition or limitation implementing any of such sections in a permit issued under section 402 of the Act, or any requirement

STANDARD CONDITIONS FOR NPDES PERMITS  
ISSUED BY  
THE MISSOURI DEPARTMENT OF NATURAL RESOURCES  
MISSOURI CLEAN WATER COMMISSION  
REVISED  
AUGUST 1, 2014

imposed in a pretreatment program approved under section 402(a)(3) or 402(b)(8) of the Act, is subject to criminal penalties of \$2,500 to \$25,000 per day of violation, or imprisonment of not more than one (1) year, or both. In the case of a second or subsequent conviction for a negligent violation, a person shall be subject to criminal penalties of not more than \$50,000 per day of violation, or by imprisonment of not more than two (2) years, or both. Any person who knowingly violates such sections, or such conditions or limitations is subject to criminal penalties of \$5,000 to \$50,000 per day of violation, or imprisonment for not more than three (3) years, or both. In the case of a second or subsequent conviction for a knowing violation, a person shall be subject to criminal penalties of not more than \$100,000 per day of violation, or imprisonment of not more than six (6) years, or both. Any person who knowingly violates section 301, 302, 303, 306, 307, 308, 318 or 405 of the Act, or any permit condition or limitation implementing any of such sections in a permit issued under section 402 of the Act, and who knows at that time that he thereby places another person in imminent danger of death or serious bodily injury, shall, upon conviction, be subject to a fine of not more than \$250,000 or imprisonment of not more than 15 years, or both. In the case of a second or subsequent conviction for a knowing endangerment violation, a person shall be subject to a fine of not more than \$500,000 or by imprisonment of not more than 30 years, or both. An organization, as defined in section 309(c)(3)(B)(iii) of the CWA, shall, upon conviction of violating the imminent danger provision, be subject to a fine of not more than \$1,000,000 and can be fined up to \$2,000,000 for second or subsequent convictions.

- c. Any person may be assessed an administrative penalty by the EPA Director for violating section 301, 302, 306, 307, 308, 318 or 405 of this Act, or any permit condition or limitation implementing any of such sections in a permit issued under section 402 of this Act. Administrative penalties for Class I violations are not to exceed \$10,000 per violation, with the maximum amount of any Class I penalty assessed not to exceed \$25,000. Penalties for Class II violations are not to exceed \$10,000 per day for each day during which the violation continues, with the maximum amount of any Class II penalty not to exceed \$125,000.
  - d. It is unlawful for any person to cause or permit any discharge of water contaminants from any water contaminant or point source located in Missouri in violation of sections 644.006 to 644.141 of the Missouri Clean Water Law, or any standard, rule or regulation promulgated by the commission. In the event the commission or the director determines that any provision of sections 644.006 to 644.141 of the Missouri Clean Water Law or standard, rules, limitations or regulations promulgated pursuant thereto, or permits issued by, or any final abatement order, other order, or determination made by the commission or the director, or any filing requirement pursuant to sections 644.006 to 644.141 of the Missouri Clean Water Law or any other provision which this state is required to enforce pursuant to any federal water pollution control act, is being, was, or is in imminent danger of being violated, the commission or director may cause to have instituted a civil action in any court of competent jurisdiction for the injunctive relief to prevent any such violation or further violation or for the assessment of a penalty not to exceed \$10,000 per day for each day, or part thereof, the violation occurred and continues to occur, or both, as the court deems proper. Any person who willfully or negligently commits any violation in this paragraph shall, upon conviction, be punished by a fine of not less than \$2,500 nor more than \$25,000 per day of violation, or by imprisonment for not more than one year, or both. Second and successive convictions for violation of the same provision of this paragraph by any person shall be punished by a fine of not more than \$50,000 per day of violation, or by imprisonment for not more than two (2) years, or both.
2. **Duty to Reapply.**
- a. If the permittee wishes to continue an activity regulated by this permit after the expiration date of this permit, the permittee must apply for and obtain a new permit.
  - b. A permittee with a currently effective site-specific permit shall submit an application for renewal at least 180 days before the expiration date of the existing permit, unless permission for a later date has been granted by the Department. (The Department shall not grant permission

for applications to be submitted later than the expiration date of the existing permit.)

- c. A permittee with currently effective general permit shall submit an application for renewal at least 30 days before the existing permit expires, unless the permittee has been notified by the Department that an earlier application must be made. The Department may grant permission for a later submission date. (The Department shall not grant permission for applications to be submitted later than the expiration date of the existing permit.)
3. **Need to Halt or Reduce Activity Not a Defense.** It shall not be a defense for a permittee in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this permit.
4. **Duty to Mitigate.** The permittee shall take all reasonable steps to minimize or prevent any discharge or sludge use or disposal in violation of this permit which has a reasonable likelihood of adversely affecting human health or the environment.
5. **Proper Operation and Maintenance.** The permittee shall at all times properly operate and maintain all facilities and systems of treatment and control (and related appurtenances) which are installed or used by the permittee to achieve compliance with the conditions of this permit. Proper operation and maintenance also includes adequate laboratory controls and appropriate quality assurance procedures. This provision requires the operation of back-up or auxiliary facilities or similar systems which are installed by a permittee only when the operation is necessary to achieve compliance with the conditions of the permit.
6. **Permit Actions.**
- a. Subject to compliance with statutory requirements of the Law and Regulations and applicable Court Order, this permit may be modified, suspended, or revoked in whole or in part during its term for cause including, but not limited to, the following:
    - i. Violations of any terms or conditions of this permit or the law;
    - ii. Having obtained this permit by misrepresentation or failure to disclose fully any relevant facts;
    - iii. A change in any circumstances or conditions that requires either a temporary or permanent reduction or elimination of the authorized discharge; or
    - iv. Any reason set forth in the Law or Regulations.
  - b. The filing of a request by the permittee for a permit modification, revocation and reissuance, or termination, or a notification of planned changes or anticipated noncompliance does not stay any permit condition.
7. **Permit Transfer.**
- a. Subject to 10 CSR 20-6.010, an operating permit may be transferred upon submission to the Department of an application to transfer signed by the existing owner and the new owner, unless prohibited by the terms of the permit. Until such time the permit is officially transferred, the original permittee remains responsible for complying with the terms and conditions of the existing permit.
  - b. The Department may require modification or revocation and reissuance of the permit to change the name of the permittee and incorporate such other requirements as may be necessary under the Missouri Clean Water Law or the Federal Clean Water Act.
  - c. The Department, within 30 days of receipt of the application, shall notify the new permittee of its intent to revoke or reissue or transfer the permit.
8. **Toxic Pollutants.** The permittee shall comply with effluent standards or prohibitions established under section 307(a) of the Federal Clean Water Act for toxic pollutants and with standards for sewage sludge use or disposal established under section 405(d) of the Federal Clean Water Act within the time provided in the regulations that establish these standards or prohibitions or standards for sewage sludge use or disposal, even if the permit has not yet been modified to incorporate the requirement.
9. **Property Rights.** This permit does not convey any property rights of any sort, or any exclusive privilege.

STANDARD CONDITIONS FOR NPDES PERMITS  
ISSUED BY  
THE MISSOURI DEPARTMENT OF NATURAL RESOURCES  
MISSOURI CLEAN WATER COMMISSION  
REVISED  
AUGUST 1, 2014

10. **Duty to Provide Information.** The permittee shall furnish to the Department, within a reasonable time, any information which the Department may request to determine whether cause exists for modifying, revoking and reissuing, or terminating this permit or to determine compliance with this permit. The permittee shall also furnish to the Department upon request, copies of records required to be kept by this permit.
11. **Inspection and Entry.** The permittee shall allow the Department, or an authorized representative (including an authorized contractor acting as a representative of the Department), upon presentation of credentials and other documents as may be required by law, to:
  - a. Enter upon the permittee's premises where a regulated facility or activity is located or conducted, or where records must be kept under the conditions of the permit;
  - b. Have access to and copy, at reasonable times, any records that must be kept under the conditions of this permit;
  - c. Inspect at reasonable times any facilities, equipment (including monitoring and control equipment), practices, or operations regulated or required under this permit; and
  - d. Sample or monitor at reasonable times, for the purposes of assuring permit compliance or as otherwise authorized by the Federal Clean Water Act or Missouri Clean Water Law, any substances or parameters at any location.
12. **Closure of Treatment Facilities.**
  - a. Persons who cease operation or plan to cease operation of waste, wastewater, and sludge handling and treatment facilities shall close the facilities in accordance with a closure plan approved by the Department.
  - b. Operating Permits under 10 CSR 20-6.010 or under 10 CSR 20-6.015 are required until all waste, wastewater, and sludges have been disposed of in accordance with the closure plan approved by the Department and any disturbed areas have been properly stabilized. Disturbed areas will be considered stabilized when perennial vegetation, pavement, or structures using permanent materials cover all areas that have been disturbed. Vegetative cover, if used, shall be at least 70% plant density over 100% of the disturbed area.
13. **Signatory Requirement.**
  - a. All permit applications, reports required by the permit, or information requested by the Department shall be signed and certified. (See 40 CFR 122.22 and 10 CSR 20-6.010)
  - b. The Federal Clean Water Act provides that any person who knowingly makes any false statement, representation, or certification in any record or other document submitted or required to be maintained under this permit, including monitoring reports or reports of compliance or non-compliance shall, upon conviction, be punished by a fine of not more than \$10,000 per violation, or by imprisonment for not more than six (6) months per violation, or by both.
  - c. The Missouri Clean Water Law provides that any person who knowingly makes any false statement, representation or certification in any application, record, report, plan, or other document filed or required to be maintained pursuant to sections 644.006 to 644.141 shall, upon conviction, be punished by a fine of not more than ten thousand dollars, or by imprisonment for not more than six months, or by both.
14. **Severability.** The provisions of the permit are severable, and if any provision of the permit, or the application of any provision of the permit to any circumstance, is held invalid, the application of such provision to other circumstances, and the remainder of the permit, shall not be affected thereby.

STANDARD CONDITIONS FOR NPDES PERMITS  
ISSUED BY  
THE MISSOURI DEPARTMENT OF NATURAL RESOURCES  
MISSOURI CLEAN WATER COMMISSION  
REVISED  
MAY 1, 2013

PART II - SPECIAL CONDITIONS – PUBLICLY OWNED  
TREATMENT WORKS  
SECTION A – INDUSTRIAL USERS

**1. Definitions**

Definitions as set forth in the Missouri Clean Water Laws and approved by the Missouri Clean Water Commission shall apply to terms used herein.

Significant Industrial User (SIU). Except as provided in the *General Pretreatment Regulation* 10 CSR 20-6.100, the term Significant Industrial User means:

1. All Industrial Users subject to Categorical Pretreatment Standards; and
2. Any other Industrial User that: discharges an average of 25,000 gallons per day or more of process wastewater to the Publicly-Owned Treatment Works (POTW) (excluding sanitary, noncontact cooling and boiler blowdown wastewater); contributes a process wastestream which makes up 5 percent or more of the average dry weather hydraulic or organic capacity of the POTW treatment plant; or is designated as such by the Control Authority on the basis that the Industrial User has a reasonable potential for adversely affecting the POTW's or for violating any Pretreatment Standard or requirement.

Clean Water Act (CWA) is the the federal Clean Water Act of 1972, 33 U.S.C. § 1251 et seq. (2002).

**2. Identification of Industrial Discharges**

Pursuant to 40 CFR 122.44(j)(1), all POTWs shall identify, in terms of character and volume of pollutants, any Significant Industrial Users discharging to the POTW subject to Pretreatment Standards under section 307(b) of the CWA and 40 CFR 403.

**3. Application Information**

Applications for renewal or modification of this permit must contain the information about industrial discharges to the POTW pursuant to 40 CFR 122.21(j)(6)

**4. Notice to the Department**

Pursuant to 40 CFR 122.42(b), all POTWs must provide adequate notice of the following:

1. Any new introduction of pollutants into the POTW from an indirect discharger which would be subject to section 301 or 306 of CWA if it were directly discharging these pollutants; and
2. Any substantial change into the volume or character of pollutants being introduced into that POTW by a source introducing pollutants into the POTW at the time of issuance of the permit.
3. For purposes of this paragraph, adequate notice shall include information on:
  - i. the quality and quantity of effluent introduced into the POTW, and
  - ii. any anticipated impact of the change on the quantity or quality of effluent to be discharged from the POTW.

For POTWs without an approved pretreatment program, the notice of industrial discharges which was not included in the permit application shall be made as soon as practicable. For POTWs with an approved pretreatment program, notice is to be included in the annual pretreatment report required in the special conditions of this permit. Notice may be sent to:

Missouri Department of Natural Resources  
Water Protection Program

Jefferson City, MO 65102

**STANDARD CONDITIONS FOR NPDES PERMITS**  
**ISSUED BY**  
**THE MISSOURI DEPARTMENT OF NATURAL RESOURCES**  
**MISSOURI CLEAN WATER COMMISSION**  
**March 1, 2015**

**PART III – SLUDGE AND BIOSOLIDS FROM DOMESTIC AND INDUSTRIAL WASTEWATER  
TREATMENT FACILITIES**

**SECTION A – GENERAL REQUIREMENTS**

1. This permit pertains to sludge requirements under the Missouri Clean Water Law and regulation for domestic wastewater and industrial process wastewater. This permit also incorporates applicable federal sludge disposal requirements under 40 CFR 503 for domestic wastewater. The Environmental Protection Agency (EPA) has principal authority for permitting and enforcement of the federal sludge regulations under 40 CFR 503 for domestic wastewater. EPA has reviewed and accepted these standard sludge conditions. EPA may choose to issue a separate sludge addendum to this permit or a separate federal sludge permit at their discretion to further address the federal requirements.
2. These PART III Standard Conditions apply only to sludge and biosolids generated at domestic wastewater treatment facilities, including public owned treatment works (POTW), privately owned facilities and sludge or biosolids generated at industrial facilities.
3. Sludge and Biosolids Use and Disposal Practices:
  - a. The permittee is authorized to operate the sludge and biosolids treatment, storage, use, and disposal facilities listed in the facility description of this permit.
  - b. The permittee shall not exceed the design sludge volume listed in the facility description and shall not use sludge disposal methods that are not listed in the facility description, without prior approval of the permitting authority.
  - c. The permittee is authorized to operate the storage, treatment or generating sites listed in the Facility Description section of this permit.
4. Sludge Received from other Facilities:
  - a. Permittees may accept domestic wastewater sludge from other facilities including septic tank pumpings from residential sources as long as the design sludge volume is not exceeded and the treatment facility performance is not impaired.
  - b. The permittee shall obtain a signed statement from the sludge generator or hauler that certifies the type and source of the sludge
5. These permit requirements do not supersede nor remove liability for compliance with county and other local ordinances.
6. These permit requirements do not supersede nor remove liability for compliance with other environmental regulations such as odor emissions under the Missouri Air Pollution Control Law and regulations.
7. This permit may (after due process) be modified, or alternatively revoked and reissued, to comply with any applicable sludge disposal standard or limitation issued or approved under Section 405(d) of the Clean Water Act or under Chapter 644 RSMo.
8. In addition to STANDARD CONDITIONS, the Department may include sludge limitations in the special conditions portion or other sections of a site specific permit.
9. Alternate Limits in the Site Specific Permit.

Where deemed appropriate, the Department may require an individual site specific permit in order to authorize alternate limitations:

  - a. A site specific permit must be obtained for each operating location, including application sites.
  - b. To request a site specific permit, an individual permit application, permit fee, and supporting documents shall be submitted for each operating location. This shall include a detailed sludge/biosolids management plan or engineering report.
10. Exceptions to these Standard Conditions may be authorized on a case-by-case basis by the Department, as follows:
  - a. The Department will prepare a permit modification and follow permit notice provisions as applicable under 10 CSR 20-6.020, 40 CFR 124.10, and 40 CFR 501.15(a)(2)(ix)(E). This includes notification of the owner of the property located adjacent to each land application site, where appropriate.
  - b. Exceptions cannot be granted where prohibited by the federal sludge regulations under 40 CFR 503.

## **SECTION B – DEFINITIONS**

1. Best Management Practices include agronomic loading rates, soil conservation practices and other site restrictions.
2. Biosolids means organic fertilizer or soil amendment produced by the treatment of domestic wastewater sludge.
3. Biosolids land application facility is a facility where biosolids are spread onto the land at agronomic rates for production of food or fiber. The facility includes any structures necessary to store the biosolids until soil, weather, and crop conditions are favorable for land application.
4. Class A biosolids means a material that has met the Class A pathogen reduction requirements or equivalent treatment by a Process to Further Reduce Pathogens (PFRP) in accordance with 40 CFR 503.
5. Class B biosolids means a material that has met the Class B pathogen reduction requirements or equivalent treatment by a Process to Significantly Reduce Pathogens (PFRP) in accordance with 40 CFR 503.
6. Domestic wastewater means wastewater originating from the sanitary conveniences of residences, commercial buildings, factories and institutions; or co-mingled sanitary and industrial wastewater processed by a (POTW) or a privately owned facility.
7. Industrial wastewater means any wastewater, also known as process water, not defined as domestic wastewater. Per 40 CFR Part 122, process water means any water which, during manufacturing or processing, comes into direct contact with or results from the production or use of any raw material, intermediate product, finished product, byproduct, or waste product.
8. Mechanical treatment plants are wastewater treatment facilities that use mechanical devices to treat wastewater, including septic tanks, sand filters, extended aeration, activated sludge, contact stabilization, trickling filters, rotating biological discs, and other similar facilities. It does not include wastewater treatment lagoons and constructed wetlands for wastewater treatment.
9. Operating location as defined in 10 CSR 20-2.010 is all contiguous lands owned, operated or controlled by one (1) person or by two (2) or more persons jointly or as tenants in common.
10. Plant Available Nitrogen (PAN) is the nitrogen that will be available to plants during the growing seasons after biosolids application.
11. Public contact site is land with a high potential for contact by the public. This includes, but is not limited to, public parks, ball fields, cemeteries, plant nurseries, turf farms, and golf courses.
12. Sludge is the solid, semisolid, or liquid residue removed during the treatment of wastewater. Sludge includes septage removed from septic tanks or equivalent facilities. Sludge does not include carbon coal byproducts (CCBs)
13. Sludge lagoon is part of a mechanical wastewater treatment facility. A sludge lagoon is an earthen basin that receives sludge that has been removed from a wastewater treatment facility. It does not include a wastewater treatment lagoon or sludge treatment units that are not a part of a mechanical wastewater treatment facility.
14. Septage is the material pumped from residential septic tanks and similar treatment works (with a design population of less than 150 people). The standard for biosolids from septage is different from other sludges.

## **SECTION C – MECHANICAL WASTEWATER TREATMENT FACILITIES**

1. Sludge shall be routinely removed from wastewater treatment facilities and handled according to the permit facility description and sludge conditions of this permit.
2. The permittee shall operate the facility so that there is no sludge discharged to waters of the state.
3. Mechanical treatment plants shall have separate sludge storage compartments in accordance with 10 CSR 20, Chapter 8. Failure to remove sludge from these storage compartments on the required design schedule is a violation of this permit.

## **SECTION D – SLUDGE DISPOSED AT OTHER TREATMENT FACILITY OR CONTRACT HAULER**

1. This section applies to permittees that haul sludge to another treatment facility for disposal or use contract haulers to remove and dispose of sludge.
2. Permittees that use contract haulers are responsible for compliance with all the terms of this permit including final disposal, unless the hauler has a separate permit for sludge or biosolids disposal issued by the Department; or the hauler transports the sludge to another permitted treatment facility.
3. Haulers who land apply septage must obtain a state permit.
4. Testing of sludge, other than total solids content, is not required if sludge is hauled to a municipal wastewater treatment facility or other permitted wastewater treatment facility, unless it is required by the accepting facility.

## **SECTION E – INCINERATION OF SLUDGE**

1. Sludge incineration facilities shall comply with the requirements of 40 CFR 503 Subpart E; air pollution control regulations under 10 CSR 10; and solid waste management regulations under 10 CSR 80.
2. Permittee may be authorized under the facility description of this permit to store incineration ash in lagoons or ash ponds. This permit does not authorize the disposal of incineration ash. Incineration ash shall be disposed in accordance with 10 CSR 80; or if the ash is determined to be hazardous with 10 CSR 25.
3. In addition to normal sludge monitoring, incineration facilities shall report the following as part of the annual report, quantity of sludge incinerated, quantity of ash generated, quantity of ash stored, and ash used or disposal method, quantity, and location. Permittee shall also provide the name of the disposal facility and the applicable permit number.

## **SECTION F – SURFACE DISPOSAL SITES AND SLUDGE LAGOONS**

1. Surface disposal sites of domestic facilities shall comply with the requirements in 40 CFR 503 Subpart C; air pollution control regulations under 10 CSR 10; and solid waste management regulations under 10 CSR 80.
2. Sludge storage lagoons are temporary facilities and are not required to obtain a permit as a solid waste management facility under 10 CSR 80. In order to maintain sludge storage lagoons as storage facilities, accumulated sludge must be removed routinely, but not less than once every two years unless an alternate schedule is approved in the permit. The amount of sludge removed will be dependent on sludge generation and accumulation in the facility. Enough sludge must be removed to maintain adequate storage capacity in the facility.
  - a. In order to avoid damage to the lagoon seal during cleaning, the permittee may leave a layer of sludge on the bottom of the lagoon, upon prior approval of the Department; or
  - b. Permittee shall close the lagoon in accordance with Section H.

## **SECTION G – LAND APPLICATION**

1. The permittee shall not land apply sludge or biosolids unless land application is authorized in the facility description or the special conditions of the issued NPDES permit.
2. Land application sites within a 20 miles radius of the wastewater treatment facility are authorized under this permit when biosolids are applied for beneficial use in accordance with these standard conditions unless otherwise specified in a site specific permit. If the permittee's land application site is greater than a 20 mile radius of the wastewater treatment facility, approval must be granted from the Department.
3. Land application shall not adversely affect a threatened or endangered species or its designated critical habitat.
4. Biosolids shall not be applied unless authorized in this permit or exempted under 10 CSR 20, Chapter 6.
  - a. This permit does not authorize the land application of domestic sludge except for when sludge meets the definition of biosolids.
  - b. This permit authorizes "Class A or B" biosolids derived from domestic wastewater and/or process water sludge to be land applied onto grass land, crop land, timber or other similar agricultural or silviculture lands at rates suitable for beneficial use as organic fertilizer and soil conditioner.
5. Public Contact Sites:

Permittees who wish to apply Class A biosolids to public contact sites must obtain approval from the Department after two years of proper operation with acceptable testing documentation that shows the biosolids meet Class A criteria. A shorter length of testing will be allowed with prior approval from the Department. Authorization for land applications must be provided in the special conditions section of this permit or in a separate site specific permit.

  - a. After Class B biosolids have been land applied, public access must be restricted for 12 months.
  - b. Class B biosolids are only land applied to root crops, home gardens or vegetable crops whose edible parts will not be for human consumption.
6. Agricultural and Silvicultural Sites:

Septage – Based on Water Quality guide 422 (WQ422) published by the University of Missouri

  - a. Haulers that land apply septage must obtain a state permit
  - b. Do not apply more than 30,000 gallons of septage per acre per year.
  - c. Septage tanks are designed to retain sludge for one to three years which will allow for a larger reduction in pathogens and vectors, as compared to other mechanical type treatment facilities.
  - d. To meet Class B sludge requirements, maintain septage at 12 pH for at least thirty (30) minutes before land application. 50 pounds of hydrated lime shall be added to each 1,000 gallons of septage in order to meet pathogen and vector stabilization for septage biosolids applied to crops, pastures or timberland.
  - e. Lime is to be added to the pump truck and not directly to the septic tanks, as lime would harm the beneficial bacteria of the septic tank.

Biosolids - Based on Water Quality guide 423, 424, and 425 (WQ423, WQ424, WQ425) published by the University of Missouri;

- a. Biosolids shall be monitored to determine the quality for regulated pollutants
- b. The number of samples taken is directly related to the amount of sludge produced by the facility (See Section I of these Standard Conditions). Report as dry weight unless otherwise specified in the site specific permit. Samples should be taken only during land application periods. When necessary, it is permissible to mix biosolids with lower concentrations of biosolids as well as other suitable Department approved material to reach the maximum concentration of pollutants allowed.
- c. Table 1 gives the maximum concentration allowable to protect water quality standards

**TABLE 1**

| Biosolids ceiling concentration <sup>1</sup> |                                    |
|----------------------------------------------|------------------------------------|
| Pollutant                                    | Milligrams per kilogram dry weight |
| Arsenic                                      | 75                                 |
| Cadmium                                      | 85                                 |
| Copper                                       | 4,300                              |
| Lead                                         | 840                                |
| Mercury                                      | 57                                 |
| Molybdenum                                   | 75                                 |
| Nickel                                       | 420                                |
| Selenium                                     | 100                                |
| Zinc                                         | 7,500                              |

<sup>1</sup> Land application is not allowed if the sludge concentration exceeds the maximum limits for any of these pollutants

- d. The low metal concentration biosolids has reduced requirements because of its higher quality and can safely be applied for 100 years or longer at typical agronomic loading rates. (See Table 2)

**TABLE 2**

| Biosolids Low Metal Concentration <sup>1</sup> |                                    |
|------------------------------------------------|------------------------------------|
| Pollutant                                      | Milligrams per kilogram dry weight |
| Arsenic                                        | 41                                 |
| Cadmium                                        | 39                                 |
| Copper                                         | 1,500                              |
| Lead                                           | 300                                |
| Mercury                                        | 17                                 |
| Nickel                                         | 420                                |
| Selenium                                       | 36                                 |
| Zinc                                           | 2,800                              |

<sup>1</sup> You may apply low metal biosolids without tracking cumulative metal limits, provided the cumulative application of biosolids does not exceed 500 dry tons per acre.

- e. Each pollutant in Table 3 has an annual and a total cumulative loading limit, based on the allowable pounds per acre for various soil categories.

**TABLE 3**

| Pollutant | CEC 15+ |                    | CEC 5 to 15 |                    | CEC 0 to 5 |                    |
|-----------|---------|--------------------|-------------|--------------------|------------|--------------------|
|           | Annual  | Total <sup>1</sup> | Annual      | Total <sup>1</sup> | Annual     | Total <sup>1</sup> |
| Arsenic   | 1.8     | 36.0               | 1.8         | 36.0               | 1.8        | 36.0               |
| Cadmium   | 1.7     | 35.0               | 0.9         | 9.0                | 0.4        | 4.5                |
| Copper    | 66.0    | 1,335.0            | 25.0        | 250.0              | 12.0       | 125.0              |
| Lead      | 13.0    | 267.0              | 13.0        | 267.0              | 13.0       | 133.0              |
| Mercury   | 0.7     | 15.0               | 0.7         | 15.0               | 0.7        | 15.0               |
| Nickel    | 19.0    | 347.0              | 19.0        | 250.0              | 12.0       | 125.0              |
| Selenium  | 4.5     | 89.0               | 4.5         | 44.0               | 1.6        | 16.0               |
| Zinc      | 124.0   | 2,492.0            | 50.0        | 500.0              | 25.0       | 250.0              |

<sup>1</sup> Total cumulative loading limits for soils with equal or greater than 6.0 pH (salt based test) or 6.5 pH (water based test)

**TABLE 4** - Guidelines for land application of other trace substances <sup>1</sup>

| Cumulative Loading |                               |
|--------------------|-------------------------------|
| Pollutant          | Pounds per acre               |
| Aluminum           | 4,000 <sup>2</sup>            |
| Beryllium          | 100                           |
| Cobalt             | 50                            |
| Fluoride           | 800                           |
| Manganese          | 500                           |
| Silver             | 200                           |
| Tin                | 1,000                         |
| Dioxin             | (10 ppt in soil) <sup>3</sup> |
| Other              | <sup>4</sup>                  |

<sup>1</sup> Design of land treatment systems for Industrial Waste, 1979. Michael Ray Overcash, North Carolina State University and Land Treatment of Municipal Wastewater, EPA 1981.)

<sup>2</sup> This applies for a soil with a pH between 6.0 and 7.0 (salt based test) or a pH between 6.5 to 7.5 (water based test). Case-by-case review is required for higher pH soils.

<sup>3</sup> Total Dioxin Toxicity Equivalents (TEQ) in soils, based on a risk assessment under 40 CFR 744, May 1998.

<sup>4</sup> Case by case review. Concentrations in sludge should not exceed the 95<sup>th</sup> percentile of the National Sewage Sludge Survey, EPA, January 2009.

Best Management Practices – Based on Water Quality guide 426 (WQ426) published by the University of Missouri

- a. Use best management practices when applying biosolids.
- b. Biosolids cannot discharge from the land application site
- c. Biosolid application is subject to the Missouri Department of Agriculture State Milk Board concerning grazing restrictions of lactating dairy cattle.
- d. Biosolid application must be in accordance with section 4 of the Endangered Species Act.
- e. Do not apply more than the agronomic rate of nitrogen needed.
- f. The applicator must document the Plant Available Nitrogen (PAN) loadings, available nitrogen in the soil, and crop removal when either of the following occurs: 1) When biosolids are greater than 50,000 mg/kg TN; or 2) When biosolids are land applied at an application rate greater than two dry tons per acre per year.
  - i. PAN can be determined as follows and is in accordance with WQ426  

$$(\text{Nitrate} + \text{nitrite nitrogen}) + (\text{organic nitrogen} \times 0.2) + (\text{ammonia nitrogen} \times \text{volatilization factor}^1).$$

<sup>1</sup> Volatilization factor is 0.7 for surface application and 1 for subsurface application.
- g. Buffer zones are as follows:
  - i. 300 feet of a water supply well, sinkhole, lake, pond, water supply reservoir or water supply intake in a stream;
  - ii. 300 feet of a losing stream, no discharge stream, stream stretches designated for whole body contact recreation, wild and scenic rivers, Ozark National Scenic Riverways or outstanding state resource waters as listed in the Water Quality Standards, 10 CSR 20-7.031;
  - iii. 150 feet if dwellings;
  - iv. 100 feet of wetlands or permanent flowing streams;
  - v. 50 feet of a property line or other waters of the state, including intermittent flowing streams.
- h. Slope limitation for application sites are as follows;
  - i. A slope 0 to 6 percent has no rate limitation
  - ii. Applied to a slope 7 to 12 percent, the applicator may apply biosolids when soil conservation practices are used to meet the minimum erosion levels
  - iii. Slopes > 12 percent, apply biosolids only when grass is vegetated and maintained with at least 80 percent ground cover at a rate of two dry tons per acre per year or less.
- i. No biosolids may be land applied in an area that it is reasonably certain that pollutants will be transported into waters of the state.
- j. Do not apply biosolids to sites with soil that is snow covered, frozen or saturated with liquid without prior approval by the Department.
- k. Biosolids / sludge applicators must keep detailed records up to five years.

## SECTION H – CLOSURE REQUIREMENTS

1. This section applies to all wastewater facilities (mechanical, industrial, and lagoons) and sludge or biosolids storage and treatment facilities and incineration ash ponds. It does not apply to land application sites.
2. Permittees of a domestic wastewater facility who plan to cease operation must obtain Department approval of a closure plan which addresses proper removal and disposal of all residues, including sludge, biosolids. Mechanical plants, sludge lagoons, ash ponds and other storage structures must obtain approval of a closure plan from the Department. Permittee must maintain this permit until the facility is closed in accordance with the approved closure plan per 10 CSR 20 – 6. 010 and 10 CSR 20 – 6.015.
3. Residuals that are left in place during closure of a lagoon or earthen structure or ash pond shall not exceed the agricultural loading rates as follows:
  - a. Residuals shall meet the monitoring and land application limits for agricultural rates as referenced in Section H of these standard conditions.
  - b. If a wastewater treatment lagoon has been in operation for 15 years or more without sludge removal, the sludge in the lagoon qualifies as a Class B biosolids with respect to pathogens due to anaerobic digestion, and testing for fecal coliform is not required. For other lagoons, testing for fecal coliform is required to show compliance with Class B biosolids limitations. In order to reach Class B biosolids requirements, fecal coliform must be less than 2,000,000 colony forming units or 2,000,000 most probable number. All fecal samples must be presented as geometric mean per gram.
  - c. The allowable nitrogen loading that may be left in the lagoon shall be based on the plant available nitrogen (PAN) loading. For a grass cover crop, the allowable PAN is 300 pounds/acre.
    - i. PAN can be determined as follows:
$$(\text{Nitrate} + \text{nitrite nitrogen}) + (\text{organic nitrogen} \times 0.2) + (\text{ammonia nitrogen} \times \text{volatilization factor}^1).$$

<sup>1</sup> Volatilization factor is 0.7 for surface application and 1 for subsurface application.
4. When closing a domestic wastewater treatment lagoon with a design treatment capacity equal or less than 150 persons, the residuals are considered “septage” under the similar treatment works definition. See Section B of these standard conditions. Under the septage category, residuals may be left in place as follows:
  - a. Testing for metals or fecal coliform is not required
  - b. If the wastewater treatment lagoon has been in use for less than 15 years, mix lime with the sludge at a rate of 50 pounds of hydrated lime per 1000 gallons (134 cubic feet) of sludge.
  - c. The amount of sludge that may be left in the lagoon shall be based on the plant available nitrogen (PAN) loading. 100 dry tons/acre of sludge may be left in the basin without testing for nitrogen. If 100 dry tons/acre or more will be left in the lagoon, test for nitrogen and determine the PAN using the calculation above. Allowable PAN loading is 300 pounds/acre.
5. Residuals left within the domestic lagoon shall be mixed with soil on at least a 1 to 1 ratio, the lagoon berm shall be demolished, and the site shall be graded and contain  $\geq 70\%$  vegetative density over 100% of the site so as to avoid ponding of storm water and provide adequate surface water drainage without creating erosion.
6. Lagoons and/or earthen structure and/or ash pond closure activities shall obtain a storm water permit for land disturbance activities that equal or exceed one acre in accordance with 10 CSR 20-6.200
7. When closing a mechanical wastewater and/or industrial process wastewater plant; all sludge must be cleaned out and disposed of in accordance with the Department approved closure plan before the permit for the facility can be terminated.
  - a. Land must be stabilized which includes any grading, alternate use or fate upon approval by the Department, remediation, or other work that exposes sediment to stormwater per 10 CSR 20-6.200. The site shall be graded and contain  $\geq 70\%$  vegetative density over 100% of the site, so as to avoid ponding of storm water and provide adequate surface water drainage without creating erosion.
  - b. Per 10 CSR 20-6.015(4)(B)6, Hazardous Waste shall not be land applied or disposed during industrial and mechanical plant closures unless in accordance with Missouri Hazardous Waste Management Law and Regulations under 10 CSR 25.
  - c. After demolition of the mechanical plant / industrial plant, the site must only contain clean fill defined in RSMo 260.200 (5) as uncontaminated soil, rock, sand, gravel, concrete, asphaltic concrete, cinderblocks, brick, minimal amounts of wood and metal, and inert solids as approved by rule or policy of the Department for fill or other beneficial use. Other solid wastes must be removed.
8. If sludge from the domestic lagoon or mechanical treatment plant exceeds agricultural rates under Section G and/or H, a landfill permit or solid waste disposal permit must be obtained if the permittee chooses to seek authorization for on-site sludge disposal under the Missouri Solid Waste Management Law and regulations per 10 CSR 80, and the permittee must comply with the surface disposal requirements under 40 CFR 503, Subpart C.

## SECTION I – MONITORING FREQUENCY

1. At a minimum, sludge or biosolids shall be tested for volume and percent total solids on a frequency that will accurately represent sludge quantities produced and disposed. Please see the table below.

**TABLE 5**

| Design Sludge Production (dry tons per year) | Monitoring Frequency (See Notes 1, 2, and 3) |                           |                           |                                           |
|----------------------------------------------|----------------------------------------------|---------------------------|---------------------------|-------------------------------------------|
|                                              | Metals, Pathogens and Vectors                | Nitrogen TKN <sup>1</sup> | Nitrogen PAN <sup>2</sup> | Priority Pollutants and TCLP <sup>3</sup> |
| 0 to 100                                     | 1 per year                                   | 1 per year                | 1 per month               | 1 per year                                |
| 101 to 200                                   | biannual                                     | biannual                  | 1 per month               | 1 per year                                |
| 201 to 1,000                                 | quarterly                                    | quarterly                 | 1 per month               | 1 per year                                |
| 1,001 to 10,000                              | 1 per month                                  | 1 per month               | 1 per week                | -- <sup>4</sup>                           |
| 10,001 +                                     | 1 per week                                   | 1 per week                | 1 per day                 | -- <sup>4</sup>                           |

<sup>1</sup> Test total Kjeldahl nitrogen, if biosolids application is 2 dry tons per acre per year or less.

<sup>2</sup> Calculate plant available nitrogen (PAN) when either of the following occurs: 1) when biosolids are greater than 50,000 mg/kg TN; or 2) when biosolids are land applied at an application rate greater than two dry tons per acre per year.

<sup>3</sup> Priority pollutants (40 CFR 122.21, Appendix D, Tables II and III) and toxicity characteristic leaching procedure (40 CFR 261.24) is required only for permit holders that must have a pre-treatment program.

<sup>4</sup> One sample for each 1,000 dry tons of sludge.

Note 1: Total solids: A grab sample of sludge shall be tested one per day during land application periods for percent total solids.

This data shall be used to calculate the dry tons of sludge applied per acre.

Note 2: Total Phosphorus: Total phosphorus and total potassium shall be tested at the same monitoring frequency as metals.

Note 3: Table 5 is not applicable for incineration and permit holders that landfill their sludge.

2. If you own a wastewater treatment lagoon or sludge lagoon that is cleaned out once a year or less, you may choose to sample only when the sludge is removed or the lagoon is closed. Test one composite sample for each 100 dry tons of sludge or biosolids removed from the lagoon during the year within the lagoon at closing. Composite sample must represent various areas at one-foot depth.
3. Additional testing may be required in the special conditions or other sections of the permit. Permittees receiving industrial wastewater may be required to conduct additional testing upon request from the Department.
4. At this time, the Department recommends monitoring requirements shall be performed in accordance with, "POTW Sludge Sampling and Analysis Guidance Document," United States Environmental Protection Agency, August 1989, and the subsequent revisions.

## SECTION J – RECORD KEEPING AND REPORTING REQUIREMENTS

1. The permittee shall maintain records on file at the facility for at least five years for the items listed in these standard conditions and any additional items in the Special Conditions section of this permit. This shall include dates when the sludge facility is checked for proper operation, records of maintenance and repairs and other relevant information.
2. Reporting period
  - a. By January 28<sup>th</sup> of each year, an annual report shall be submitted for the previous calendar year period for all mechanical wastewater treatment facilities, sludge lagoons, and sludge or biosolids disposal facilities.
  - b. Permittees with wastewater treatment lagoons shall submit the above annual report only when sludge or biosolids are removed from the lagoon during the report period or when the lagoon is closed.
3. Report Forms. The annual report shall be submitted on report forms provided by the Department or equivalent forms approved by the Department.
4. Reports shall be submitted as follows:

Major facilities (those serving 10,000 persons or 1 million gallons per day) shall report to both the Department and EPA. Other facilities need to report only to the Department. Reports shall be submitted to the addresses listed as follows:

DNR regional office listed in your permit  
(see cover letter of permit)  
ATTN: Sludge Coordinator

EPA Region VII  
Water Compliance Branch (WACM)  
Sludge Coordinator  
11201 Renner Blvd.  
Lenexa, KS 66219

5. Annual report contents. The annual report shall include the following:
- a. Sludge and biosolids testing performed. Include a copy or summary of all test results, even if not required by the permit.
  - b. Sludge or biosolids quantity shall be reported as dry tons for quantity generated by the wastewater treatment facility, the quantity stored on site at the end of the year, and the quantity used or disposed.
  - c. Gallons and % solids data used to calculate the dry ton amounts.
  - d. Description of any unusual operating conditions.
  - e. Final disposal method, dates, and location, and person responsible for hauling and disposal.
    - i. This must include the name, address for the hauler and sludge facility. If hauled to a municipal wastewater treatment facility, sanitary landfill, or other approved treatment facility, give the name of that facility.
    - ii. Include a description of the type of hauling equipment used and the capacity in tons, gallons, or cubic feet.
  - f. Contract Hauler Activities:  
If contract hauler, provide a copy of a signed contract from the contractor. Permittee shall require the contractor to supply information required under this permit for which the contractor is responsible. The permittee shall submit a signed statement from the contractor that he has complied with the standards contained in this permit, unless the contract hauler has a separate sludge or biosolids use permit.
  - g. Land Application Sites:
    - i. Report the location of each application site, the annual and cumulative dry tons/acre for each site, and the landowners name and address. The location for each spreading site shall be given as a legal description for nearest ¼, ¼, Section, Township, Range, and county, or UTM coordinates. The facility shall report PAN when either of the following occurs: 1) When biosolids are greater than 50,000 mg/kg TN; or 2) when biosolids are land applied at an application rate greater than two dry tons per acre per year.
    - ii. If the "Low Metals" criteria are exceeded, report the annual and cumulative pollutant loading rates in pounds per acre for each applicable pollutant, and report the percent of cumulative pollutant loading which has been reached at each site.
    - iii. Report the method used for compliance with pathogen and vector attraction requirements.
    - iv. Report soil test results for pH, CEC, and phosphorus. If none was tested during the year, report the last date when tested and results.

JUL 18 2016

MISSOURI DEPARTMENT OF NATURAL RESOURCES  
WATER PROTECTION PROGRAM, WATER POLLUTION CONTROL BRANCH

Water Protection Program

**FORM B2 – APPLICATION FOR OPERATING PERMIT FOR FACILITIES THAT RECEIVE  
PRIMARILY DOMESTIC WASTE AND HAVE A DESIGN FLOW MORE THAN 100,000 GALLONS  
PER DAY**

FACILITY NAME

Shoal Creek Neosho MO.

PERMIT NO.

MO 0104906

COUNTY

Newton

**APPLICATION OVERVIEW**

Form B2 has been developed in a modular format and consists of Parts A, B and C and a Supplemental Application Information (Parts D, E, F and G) packet. All applicants must complete Parts A, B and C. Some applicants must also complete parts of the Supplemental Application Information packet. The following items explain which parts of Form B2 you must complete. Submittal of an incomplete application may result in the application being returned.

**BASIC APPLICATION INFORMATION**

- A. Basic Application Information for all Applicants. All applicants must complete Part A.
- B. Additional Application Information for all Applicants. All applicants must complete Part B.
- C. Certification. All applicants must complete Part C.

**SUPPLEMENTAL APPLICATION INFORMATION**

- D. Expanded Effluent Testing Data. A treatment works that discharges effluent to surface water of the United States and meets one or more of the following criteria must complete *Part D - Expanded Effluent Testing Data*:
  - 1. Has a design flow rate greater than or equal to 1 million gallons per day.
  - 2. Is required to have or currently has a pretreatment program.
  - 3. Is otherwise required by the permitting authority to provide the information.
- E. Toxicity Testing Data. A treatment works that meets one or more of the following criteria must complete *Part E - Toxicity Testing Data*:
  - 1. Has a design flow rate greater than or equal to 1 million gallons per day.
  - 2. Is required to have or currently has a pretreatment program.
  - 3. Is otherwise required by the permitting authority to provide the information.
- F. Industrial User Discharges and Resource Conservation and Recovery Act / Comprehensive Environmental Response, Compensation and Liability Act Wastes. A treatment works that accepts process wastewater from any significant industrial users, also known as SIUs, or receives a Resource Conservation and Recovery Act or CERCLA wastes must complete *Part F - Industrial User Discharges and Resource Conservation and Recovery Act /CERCLA Wastes*.  
SIUs are defined as:
  - 1. All Categorical Industrial Users, or CIUs, subject to Categorical Pretreatment Standards under 40 Code of Federal Regulations 403.6 and 40 Code of Federal Regulations 403.6 and 40 CFR Chapter 1, Subchapter N.
  - 2. Any other industrial user that meets one or more of the following:
    - i. Discharges an average of 25,000 gallons per day or more of process wastewater to the treatment works (with certain exclusions).
    - ii. Contributes a process waste stream that makes up five percent or more of the average dry weather hydraulic or organic capacity of the treatment plant.
    - iii. Is designated as an SIU by the control authority.
    - iv. Is otherwise required by the permitting authority to provide the information.
- G. Combined Sewer Systems. A treatment works that has a combined sewer system must complete *Part G - Combined Sewer Systems*.

**ALL APPLICANTS MUST COMPLETE PARTS A, B and C**

| Applicants must provide effluent testing data for the following parameters. Provide the indicated effluent data <b>for each outfall through which effluent is discharged</b> . Do not include information of combined sewer overflows in this section. All information reported must be based on data collected through analysis conducted using 40 CFR Part 136 methods. In addition, this data must comply with QA/QC requirements of 40 CFR Part 136 and other appropriate QA/QC requirements for standard methods for analytes not addressed by 40 CFR Part 136. At a minimum, effluent testing data must be based on at least <b>three samples</b> and must be no more than four and one-half years apart. |                         |                           |                         |                    |                   |        |           |              |

**PART D – EXPANDED EFFLUENT TESTING DATA**

**16. EXPANDED EFFLUENT TESTING DATA**

Refer to the APPLICATION OVERVIEW to determine whether Part D applies to the treatment works.

If the treatment works has a design flow greater than or equal to 1 million gallons per day or it has (or is required to have) a pretreatment program, or is otherwise required by the permitting authority to provide the data, then provide effluent testing data for the following pollutants. Provide the indicated effluent testing information **for each outfall through which effluent is discharged**. Do not include information of combined sewer overflows in this section. All information reported must be based on data collected through analysis conducted using 40 CFR Part 136 methods. The facility shall use sufficiently sensitive analytical methods for detecting, identifying, and measuring the concentrations of pollutants. In addition, this data must comply with QA/QC requirements of 40 CFR Part 136 and other appropriate QA/QC requirements for standard methods for analytes not addressed by 40 CFR Part 136. Indicate in the blank rows provided below any data you may have on pollutants not specifically listed in this form. At a minimum, effluent testing data must be based on at least **three pollutant scans** and must be no more than four and one-half years apart.

Outfall Number (Complete Once for Each Outfall Discharging Effluent to Waters of the State.)

**PART F – INDUSTRIAL USER DISCHARGES AND RCRA/CERCLA WASTES**

Refer to the APPLICATION OVERVIEW to determine whether Part F applies to the treatment works.

**18. GENERAL INFORMATION****18.1** Does the treatment works have, or is it subject to, an approved pretreatment program?☒ Yes☐ No**18.2** Number of Significant Industrial Users (SIUs) and Categorical Industrial Users (CIUs). Provide the number of each of the following types of industrial users that discharge to the treatment works:Number of non-categorical SIUs 1Number of CIUs 0**19. INDUSTRIES CONTRIBUTING MORE THAN 5 PERCENT OF THE ACTUAL FLOW TO THE FACILITY OR OTHER SIGNIFICANT INDUSTRIAL USERS INFORMATION**

Supply the following information for each SIU. If more than one SIU discharges to the treatment works, provide the information requested for each. Submit additional pages as necessary.

NAME

Rembrandt Foods

MAILING ADDRESS

**19.1** Describe all of the industrial processes that affect or contribute to the SIU's discharge  
egg pasteurization**19.2** Describe all of the principle processes and raw materials that affect or contribute to the SIU's discharge.

Principal Product(s): egg pasteurization

Raw Material(s): egg

**19.3 Flow Rate****a. PROCESS WASTEWATER FLOW RATE.** Indicate the average daily volume of process wastewater discharged into the collection system in gallons per day, or gpd, and whether the discharge is continuous or intermittent.33,500 gpd ☐ Continuous ☒ Intermittent**b. NON-PROCESS WASTEWATER FLOW RATE.** Indicate the average daily volume of non-process wastewater discharged into the collection system in gallons per day, or gpd, and whether the discharge is continuous or intermittent.33,500 gpd ☐ Continuous ☒ Intermittent**19.4** Pretreatment Standards. Indicate whether the SIU is subject to the following:**a. Local Limits** ☐ Yes ☒ No**b. Categorical Pretreatment Standards** ☐ Yes ☒ No

If subject to categorical pretreatment standards, which category and subcategory?

**19.5** Problems at the treatment works attributed to waste discharged by the SIU. Has the SIU caused or contributed to any problems (e.g., upsets, interference) at the treatment works in the past three years?☐ Yes☒ No

If Yes, describe each episode

**MAKE ADDITIONAL COPIES OF THIS FORM FOR EACH OUTFALL**FACILITY NAME  
Shoal CreekPERMIT NO.  
MO- 0104906OUTFALL NO.  
001**PART G – COMBINED SEWER SYSTEMS**

Refer to the APPLICATION OVERVIEW to determine whether Part G applies to the treatment works.

**22. GENERAL INFORMATION****22.1 System Map.** Provide a map indicating the following: (May be included with basic application information.)

- A. All CSO Discharges.
- B. Sensitive Use Areas Potentially Affected by CSOs. (e.g., beaches, drinking water supplies, shellfish beds, sensitive aquatic ecosystems and Outstanding Natural Resource Waters.)
- C. Waters that Support Threatened and Endangered Species Potentially Affected by CSOs.

**22.2 System Diagram.** Provide a diagram, either in the map provided above or on a separate drawing, of the Combined Sewer Collection System that includes the following information:

- A. Locations of Major Sewer Trunk Lines, Both Combined and Separate Sanitary.
- B. Locations of Points where Separate Sanitary Sewers Feed into the Combined Sewer System.
- C. Locations of In-Line or Off-Line Storage Structures.
- D. Locations of Flow-Regulating Devices.
- E. Locations of Pump Stations.

**22.3** Percent of collection system that is combined sewer 0%**22.4** Population served by combined sewer collection system**22.5** Name of any satellite community with combined sewer collection system**23. CSO OUTFALLS. COMPLETE THE FOLLOWING ONCE FOR EACH CSO DISCHARGE POINT****23.1** Description of Outfall

- a. Outfall Number
- b. Location

c. Distance from Shore (if applicable) \_\_\_\_\_ ft

d. Depth Below Surface (if applicable) \_\_\_\_\_ ft

e. Which of the following were monitored during the last year for this CSO?

- ☐ Rainfall
- ☐ CSO Pollutant Concentrations
- ☐ CSO
- ☐ CSO Flow Volume
- ☐ Receiving Water Quality

f. How many storm events were monitored last year?

**23.2** CSO Events

- a. Give the Number of CSO Events in the Last Year      Events      ☐ Actual      ☐ Approximate
- b.      Give the Average Duration Per CSO Event
- Hours      ☐ Actual      ☐ Approximate
- c.      Give the Average Volume Per CSO Event
- Million Gallons      ☐ Actual      ☐ Approximate
- d. Give the minimum rainfall that caused a CSO event in the last year \_\_\_\_\_ inches of rainfall

**23.3** Description of Receiving Waters

- a. Name of Receiving Water
- b. Name of Watershed/River/Stream System
- c. U.S. Soil Conservation Service 14-Digit Watershed Code (If Known)
- d. Name of State Management/River Basin
- e. U.S. Geological Survey 8- Digit Hydrologic Cataloging Unit Code (If Known)

**23.4** CSO Operations

Describe any known water quality impacts on the receiving water caused by this CSO (e.g., permanent or intermittent beach closings, permanent or intermittent shellfish bed closings, fish kills, fish advisories, other recreational loss, or violation of any applicable state water quality standard.)

## **Appendix D – MDNR Inspection Reports**

**MISSOURI**  
DEPARTMENT OF  
NATURAL RESOURCES

Michael L. Parson  
Governor

Dru Buntin  
Director

September 7, 2023

David Kennedy, City Manager  
City of Neosho  
203 East Main Street  
Neosho, MO 64850

**UNSATISFACTORY FINDINGS  
RESPONSE REQUIRED**

Dear David Kennedy:

On July 19, 2023, a team member from the Missouri Department of Natural Resources conducted an inspection of the Neosho Wastewater Treatment Plant, located on Old Scenic Drive 0.1 miles north of the Jefferson Avenue intersection, Neosho in Newton County. The entity operates under the authority of Missouri State Operating Permit MO0104906.

Compliance with Missouri Clean Water Law was evaluated. The enclosed report is being issued with Unsatisfactory Findings for the violations identified.

Please refer to the enclosed report for details on the findings and required actions. **A written response documenting actions taken to correct the violations is required by the date specified in the report.**

Fact sheets are available on the Department's website to assist entities with understanding and following environmental requirements.

If you have any questions or would like to schedule a time to meet with a Department team member to discuss compliance requirements, please contact Joshua Grosvenor, EI, by calling 417-891-4300, by email at [SWRO@dnr.mo.gov](mailto:SWRO@dnr.mo.gov), or via mail at Southwest Regional Office, 2040 W. Woodland, Springfield, Missouri 65807-5912.

Sincerely,

SOUTHWEST REGIONAL OFFICE -

**Randall Willoughby, CHMM**  
Water Pollution Section Chief

RDW/jgn

# Compliance Summary

**Facility Name: Neosho WWTP**

**Permit Number: MO0104906**

**Inspection Date: July 19, 2023**

**This summary is intended to direct your attention to violations noted during the inspection of your facility.**

## **Violations noted during the inspection:**

1. A review of the Discharge Monitoring Reports (DMRs) from July 2021 to July 2023 shows violations of permitted limitations. Failure to comply with the effluent limits is a violation of the MSOP, MSOP MO0104906, Missouri Clean Water Law Sections 644.051.1(3) and 644.076.1, RSMo and Missouri Clean Water Commission Regulation 10 CSR 20-7.015.
2. An effluent sample collected by a Department team member on January 11, 2023, revealed a violation of permitted effluent limits as shown in the table in the Sampling and Monitoring Section of the Report. Failure to comply with permitted effluent limits is a violation of Missouri Clean Water Law Sections 644.051.1(3) and 644.076.1, RSMo, and Missouri Clean Water Commission Regulation 10 CSR 20-7.015.

## **Actions necessary to return to compliance:**

1. You have provided a comment during the submittal of the eDMR for the exceedances that addressed the required response.
2. Submit a written response detailing actions to prevent any future occurrences.

Refer to the Unsatisfactory Findings section on pages 4 through 5 of the enclosed report for detailed information about these violations and how to correct them so your facility may be returned to compliance.

**We appreciate your prompt attention to these issues. If you have any questions, or if you would like to meet to discuss these violations further, please contact Joshua Grosvenor, EI, at our Southwest Regional Office at (417)891-4300 or at [swro@dnr.mo.gov](mailto:swro@dnr.mo.gov).**

**Missouri Department of Natural Resources  
Southwest Regional Office  
Report of Inspection  
Neosho WWTP  
Newton County  
MO0104906  
September 7, 2023**

## **Introduction**

On July 19, 2023, a routine compliance inspection of the Neosho WWTP in Newton County, Missouri was conducted by the Missouri Department of Natural Resources. The purpose of this inspection was to determine compliance with the Missouri State Operating Permit (MSOP) MO0104906, the Missouri Clean Water Commission Regulations, and the Missouri Clean Water Law. This report presents the findings and observations made during the compliance inspection. Authority for this inspection is provided in Missouri Clean Water Law 644.026.1(21), RSMo. The following participants were present during the inspection:

### Neosho WWTP

Ken Brady, Local Manager, Alliance Water Resources

Jerry Humphrey, Pretreatment Inspector, Alliance Water Resources

### Missouri Department of Natural Resources

Joshua Grosvenor, EI, Environmental Engineer

## **Entity Description and History**

The wastewater treatment facility is owned by the City of Neosho, located at 203 East Main Street. The City contracts with Alliance Water Resources, Inc., to operate the WWTP. The facility is composed of two separate facilities that were previously permitted separately, Neosho Crowder WWTP and Neosho Shoal Creek WWTP. All effluent from the Neosho Crowder WWTP is sent to the Neosho Shoal Creek WWTP, where flows are combined prior to ultraviolet disinfection. The Neosho Crowder WWTP consists of flow equalization, bar screen, pre-aeration basins, primary clarifiers, trickling filters, recirculation basin, secondary clarification, and aerobic sludge digesters. The Neosho Shoal Creek WWTP consists of flow equalization, bar screen, oxidation ditches, aerobic sludge digesters, aerated sludge holding, and ultraviolet disinfection. The system has a design flow capacity of six million gallons per day. Sludge is land applied. The collection system is composed of approximately six miles of force main, 120 miles of gravity mains, six lift stations, and 2,500 manholes. The discharge from this facility flows into Shoal Creek classified as a gaining setting. The discharge is located in the Spring Basin (11070207) HUC 8 watershed. The facility has a design population equivalent of 59,000. The facility is required to have a Class (A) operator. The UTM 83 coordinates for this facility's outfall are E 377523, N 4084102. The MSOP MO0104906 was last issued on May 1, 2017, and expired on April 30, 2022. An application for renewal has been received by the Department and is in the process of being renewed.

Our records indicate that the Department conducted the previous inspection of this facility on August 21, 2019. The previous inspection listed effluent limitation violations, failure to provide proper notification of violations, missing limit parameters, failure to provide properly signed I&I and sludge reports, operation and maintenance issues, failure to implement a Stormwater Pollution Prevention Plan, and failure to conform to required analytical and sampling methods failure to report a bypass. A Letter of Warning (LOW) was issued for the documented violations.

Sufficient responses were received on September 30 and October 10, 2019, and the facility was returned to compliance on November 25, 2019.

During the office portion of the inspection, I reviewed the facility's file and Department records. The facility is current on their annual permit fee. I reviewed the facility's Form S Annual Sludge Report and Discharge Monitoring Reports (DMRs). The previous year's Annual Sludge Report was received by the Department on February 1, 2023, prior to the February 19<sup>th</sup> deadline.

I conducted a review of the facility's DMRs submitted to this office from July 2021 to July 2023 reflect overall compliance with MSOP limits and reporting requirements. The facility submits DMRs through the Department's Electronic Discharge Monitoring Report (eDMR) system. The following tables include the effluent limit exceedances that occurred during this period:

| Outfall #001  |                            |                                                     |                 |
|---------------|----------------------------|-----------------------------------------------------|-----------------|
| REPORT PERIOD | PARAMETER                  | MSOP LIMIT                                          | REPORTED RESULT |
| December 2021 | Cadmium, Total Recoverable | 0.6 µg/L Daily Maximum<br>0.3 µg/L Monthly Average  | 0.41 µg/L       |
|               | Ammonia as N               | 11.9 mg/L Daily Maximum<br>2.2 mg/L Monthly Average | 7.3 mg/L        |

| Internal Monitoring Point #IP5 |                                    |                                |                 |

| January 2023                   | BOD <sub>5</sub> | 65 mg/L Weekly Average<br>45 mg/L Monthly Average | 111 mg/L        |

### Discussion of Inspection and Observations

The inspection was conducted during normal business hours. I contacted Ken Brady on July 11, 2023, to provide notification of the inspection to ensure timely access to the site.

I arrived at the facility at approximately 9:00 a.m., and met with Ken Brady and Jerry Humphrey, and outlined the statutory authority, purpose, and scope of the inspection. I was granted permission to access the site and was accompanied throughout the tour of the facility.

The laboratory procedures and operational tests were reviewed. The City had a quality assurance and quality control (QA/QC) program for the laboratory and applicable equipment is recertified annually.

We discussed any sanitary sewer overflows (SSO) in the collection system and bypasses at the treatment facility for the last two years. The City has reported three (3) SSOs in 2023, four (4) SSOs in 2022, and three (3) SSOs in 2021. The City had no reported bypasses at the treatment facility during the reviewed time period. The occurrences were all attributed to heavy rainfall events.

A review of the submitted annual inflow and infiltration (I&I) report, for the year 2022, indicated the City observed a total of 206 manholes and rehabbed one (1) brick manhole. A total of 2,100 feet of collection line was smoke tested, 7,599 feet were inspected by Closed-Circuit Television (CCTV) with 43,880 feet cleaned. The City has adopted a program for the maintenance and repair of the collection system as required.

I reviewed copies of their laboratory analysis records and compared those records to the data submitted by the facility to the Department. I did not observe any discrepancies in the records.

We conducted a tour of the Neosho WWTP. We began at the receiving station for hauled wastewater (Photo 1), all wastes that are hauled to the facility enter at this point. I observed the sludge/wastewater holding tank (Photo 2). Flow then passes through the bar screen (Photo 3). The rotors in the oxidation ditches were operational and appeared to be providing adequate mixing (Photos 4 & 5). One of the two final clarifiers was in operation (Photos 6 & 7), and the second final clarifier was drained and awaiting routine maintenance (Photos 8 & 9). Flow is measured with a Parshall flume and flow transducer (Photo 10). The combined flows are treated with ultraviolet disinfection (Photo 11), and the treatment tanks were operational at the time of inspection.

The sludge holding tanks are located west of the treatment facility (Photo 12). Pump trucks connect and pull from a transfer structure (Photo 13). The outfall is marked as required (Photo 14). The receiving stream (Photo 15), did not appear to be impacted from the discharge.

I then observed the eight million gallon peak flow basin (Photos 16 & 17). Water from this basin is pumped to the treatment facility via a connected pump station (Photo 18). The peak flow pump station has a generator backup that is exercised regularly (Photo 19).

I observed the Jay Drive lift station (Photos 20 - 22), the lift station is surrounded by a security fence and has an audio/visual alarm system. The Jay Drive lift station appeared to have an accumulation of debris that needs to be removed. I then observed the Quince Road lift station (Photos 23-25), the lift station is surrounded by a security fence and has an audio/visual alarm

system. All lift stations in the collection system are visually inspected daily and a log is kept at each lift station (Photo 26). I then observed a manhole located near the intersection of S Neosho Boulevard and W South Street (Photos 27 & 28), this manhole has the most SSO issues. Since 2021 there have been five (5) reported SSOs at this manhole location. It was stated that the interceptor line downstream of this manhole will fill during high rainfall events and cause flows to back up and overflow. The City is currently in the process of correcting this issue. It was stated that the collection system downstream of the manhole will have a higher flow during times of high I&I and cause the system to back up out of this manhole.

I conducted an exit meeting with Ken Brady and Jerry Humphrey and outlined the preliminary findings. I explained the observations and any associated violations. I also provided recommendations on returning any violations to compliance. The recommendations are in the section below. I thanked Brady and Humphrey for their time and cooperation and departed the facility at 2:00 p.m.

### Sampling and Monitoring

The Department's Environmental Services Program (ESP) team members conducted compliance sampling at the WWTF on January 10-11, 2023. The attached sample results reflect non-compliance with the effluent limits set forth in the MSOP, MO0104906. The following table includes the effluent limit exceedances that occurred during this sampling event:

| Internal Monitoring Point #IP3 |                                                   |                 |
|--------------------------------|---------------------------------------------------|-----------------|
| PARAMETER                      | MSOP LIMIT                                        | REPORTED RESULT |
| BOD <sub>5</sub>               | 65 mg/L Weekly Average<br>45 mg/L Monthly Average | 164 mg/L        |

### Compliance Determination, Violations, and Required Actions

Based on observations made at the time of the inspection, the facility was found to be out of compliance with the Missouri Clean Water Law, its implementing regulations, and MSOP MO0104906.

### Unsatisfactory Findings

Please submit your responses to the following violations **by October 10, 2023**, to the Southwest Regional Office, 2040 W. Woodland, Springfield, MO 65807.

1. A review of the Discharge Monitoring Reports (DMRs) from July 2021 to July 2023 shows violations of permitted limitations. Failure to comply with the effluent limits is a violation of the MSOP, MSOP MO0104906, Missouri Clean Water Law Sections 644.051.1(3) and 644.076.1, RSMo and Missouri Clean Water Commission Regulation 10 CSR 20-7.015.

**REQUIRED ACTION:** You have provided a comment during the submittal of the eDMR that addressed the required response.

2. An effluent sample collected by a Department team member on January 11, 2023, revealed a violation of permitted effluent limits as shown in the table in the Sampling and Monitoring Section of the Report. Failure to comply with permitted effluent limits is a violation of Missouri Clean Water Law Sections 644.051.1(3) and 644.076.1, RSMo, and Missouri Clean Water Commission Regulation 10 CSR 20-7.015.

**REQUIRED ACTION:** Submit a written response detailing actions to prevent any future occurrences.

### **Recommendations**

Please continue to evaluate and repair the collection system to reduce the inflow and infiltration.

The city is reminded to notify the department of all SSOs and bypasses within 24 hours and submit a written report within five (5) business days of the time the city becomes aware of an SSO or bypass as required in MSOP, MO0094854, Special Condition 12 and Standard Condition Part I, Section B. Bypasses and SSOs are to be reported to the department's Southwest Regional Office during normal business hours or by using the online SSOs and Bypass website at <http://dnr.mo.gov/modnrcag/> or the Environmental Emergency Response hotline at 573-634-2436 outside of normal business hours.

## **Appendix E – Sludge Hauling Cost Calculations**

Days Hauling

|                |     |
|----------------|-----|
| Loads per Year | 595 |
| Loads per Day  | 12  |
| Days per Year  | 50  |

Personnel

|                          |              |
|--------------------------|--------------|
| Personnel Rate (\$/Hr)   | \$ 18.00     |
| Personnel at 8 Hr/Day    | 2            |
| Personnel at 6 Hr/Day    | 1            |
| Personnel Cost (\$/Day)  | \$ 396.00    |
| Personnel Cost (\$/Year) | \$ 19,635.00 |

Power

| No. Pumps | HP | Hr/Day | kW-Hr/Day | \$/kW-Hr  | \$/Day       |
|-----------|----|--------|-----------|-----------|--------------|
|           | 1  | 5      | 4         | 14.914 \$ | 0.11 \$ 1.64 |
|           | 2  | 5      | 8         | 59.656 \$ | 0.11 \$ 6.56 |

|                      |           |
|----------------------|-----------|
| Power Cost (\$/Day)  | \$ 8.20   |
| Power Cost (\$/Year) | \$ 406.72 |

|                    |             |
|--------------------|-------------|
| Fuel Cost per Year | \$ 7,000.00 |
|--------------------|-------------|

Maintenance and Replacement

|                                            |               |
|--------------------------------------------|---------------|
| Tires (\$/Year)                            | \$ 4,000.00   |
| Oil (\$/Year)                              | \$ 1,000.00   |
| Repair Parts (\$/Year)                     | \$ 2,000.00   |
| Personnel Rate (\$/Hr)                     | \$ 18.00      |
| Maintenance (Hr/Year)                      | 50            |
| Maintenance (\$/Year)                      | \$ 900.00     |
| Truck Purchase Cost                        | \$ 160,000.00 |
| No. of Trucks                              | 2             |
| Truck Life                                 | 10            |
| Truck Salvage Value                        | \$ 30,000.00  |
| Truck Replacement (\$/Year)                | \$ 26,000.00  |
| Maintenance and Replacement Cost (\$/Year) | \$33,900      |

|                      |              |
|----------------------|--------------|
| Total Cost (\$/Year) | \$ 60,941.72 |
|----------------------|--------------|

# Playground Stencils

## Encourage Active Outdoor Play

Available for loan to Missouri child care facilities, schools, parks and local public health agencies — no charge!

Painted playground designs are inexpensive and safe!

Children learn letters, numbers, colors, shapes, pathways and sequences while being physically active. They have fun as they practice agility, stretching, balance, eye/foot coordination and locomotor movement skills.

### You must have:

- ♦ A clean, paved play surface
- ♦ Ability to provide paint and other supplies
- ♦ People to do the painting
- ♦ Permission to paint from property owner

### We provide:

- ♦ Several stencil designs to choose from
- ♦ Instructions for painting

More information on our webpage: [www.health.mo.gov/playgroundstencils](http://www.health.mo.gov/playgroundstencils)

## PLAYGROUND STENCILS AVAILABLE

### CHOOSE FRUIT HOPSCOTCH -

A variation of the traditional hopscotch that allows children to become familiar with fruit

Size: 3'x14'

DHSS Warehouse #11240

### DINOSAUR HOPSCOTCH -

This game enables children to learn the alphabet and to spell words

Size: 7'x16'

DHSS Warehouse #11254

### SNAKE HOPSCOTCH -

This game allows children to learn how to jump on one foot, gain their balance and recognize the order of the alphabet

Size: 4'x21'

DHSS Warehouse #11255

### **HUMAN FOOTPRINTS**

Footprints can be laid out in any fashion to create a trail to follow

3 Pieces (all the same) – 1' x 4'

DHSS Warehouse #11273

### **SNAIL HOPSCOTCH -**

Players move through the squares claiming them as their own, making it more difficult for others to complete

Size: 7'x 8'

DHSS Warehouse #11276

### **SILLY SHOES -**

Children move along the foot print from start to end using methods such as sliding, hopping, etc.

Size: 9' x 13'

DHSS Warehouse #11277

### **HOPSCOTCH WITH HOME –**

The traditional game about throwing, hopping, and not falling over

Size: 3' x 14'

DHSS Warehouse #11278

### **FIND THE CORRECT PATH GAME -**

Each child stands on a shape and will walk or race on the line that takes them to the correct shape on the opposite side

Size: 7' x 15'

DHSS Warehouse #11279

### **CROCODILE HOPSCOTCH -**

A variation of traditional game where children can pretend to be jumping on the crocodile's back

Size: 5' x 18'

DHSS Warehouse #11281

### **FOOTPRINTS #2 -**

Human, Lion, Beaver, Goose: Foot prints can be laid out in any fashion to create a trail to follow

Size: Varies, not bigger than 1' x 5'

DHSS Warehouse #11285

### **GIANT SHAPE CIRCLE-**

Can be used to play any number of games that require children to stand in a circle

Size: 30' x 30'

DHSS Warehouse #11286

### **FOOTPRINTS #1 -**

**Human, Rabbit, Dinosaur, Bear.** Foot prints can be laid out in any fashion to create a trail to follow

Size: Varies, not bigger than 1' x 4'

DHSS Warehouse #11288

### ROCKET HOPSCOTCH -

Children can pretend they are taking a rocket ship to the moon and back in this variation of the traditional hopscotch

Size: 4x14'

DHSS Warehouse #11433

### BLOCKS HOPSCOTCH -

A variation of the traditional hopscotch

Size: 3' x 9'4"

DHSS Warehouse #11436

### NUMBER SWIRL -

This is an excellent beginner game for young children as they learn how to jump on one foot, gain their balance and recognize the order of elementary numbers

Size: 3' x 18'

DHSS Warehouse #11438

### **SHAPES SWIRL -**

Children learn basic shapes while following a swirl pattern

Size: 3' x 21'

DHSS Warehouse #11441

### **PIRATE'S TREASURE MAP -**

A game of imagination and activity; as a pirate, the children swim, walk, climb, cross, hop and step through the map.

Size: 25' x 25'

or get creative to make your own map in different lengths/widths

DHSS Warehouse #11445

### **PLAYGROUND POND -**

A game of imagination and activity; at each stage of the game the children pretend to be the animal doing the movements laid out in the pond

Size: 25' x 25' or get creative to make your own design in different lengths/ widths

DHSS Warehouse #11447

## PLAYGROUND STENCIL PAINTING INSTRUCTIONS

### ***Advance Preparation***

1. Choose your location. Choose a smooth asphalt or concrete surface. Measure to make sure your designs will fit. Avoid areas near heavy dirt and sand. Leave enough space between stencil designs and other playground equipment to allow children to move safely.
2. Choose your painting day. Check the weather and choose a day that should be dry, not too windy and not extremely hot or cold.
3. Prepare surface. Clean surface to remove rocks, dirt and other debris. Power washing is recommended.
4. Collect supplies needed.
  - **Paint-** Ask your paint store to recommend the best paint for your surface. Special asphalt or curb marking paint is normally used. Bright primary colors and white stand out the most.
  - **Paintbrushes-** 1 to 3 inch brushes. Do not use expensive brushes for this project.
  - **Paint cups-** Save disposable plastic containers for mixing.
  - **Paint station-** Tarp, old sheet or cardboard. All paint should be poured and mixed at this station to contain spills.
  - **Thick masking tape-** to tape down stencils.
  - **Chalk-** to outline stencils or draw free-hand designs.
  - **Weights-** Rocks, bricks, etc. to hold down stencils on windy days.
  - **Clean up supplies-** Old rags and paper towels. Water or paint thinner depending on the kind of paint used.

### ***Paint Day***

1. Lay stencils out on surface, making sure all pieces are put together in the right order. Use masking tape to hold pieces together.
2. Plan colors for each part of the design. Simple is better. Too many colors can be overwhelming.
3. Two methods for painting:
  - a. The **preferred method** is to draw outline of stencils with chalk, then remove stencils and paint within the chalk lines. This keeps the stencils clean and there is less risk of them blowing away. This method also results in smoother lines.
  - b. Secure stencils with tape and weights, then paint along the stencil. Check often to make sure the paint is not bleeding past the stencil outline. This method can result in smeared edges.

Use a 1 or 2 inch brush to paint the outline of the shape first. Then fill in shape using the same brush or a 3 inch brush. Paint at least 2 thin coats and allow to dry between coats. If the paint goes on too thick, it may peel later.

4. Allow paint to dry for 24 hours before use.
5. Remove masking tape and wipe down stencils with a wet rag to remove excess paint. Do not use paint thinner on stencils.
6. Make sure stencils are dry before placing back in the bag.

#### **Maintenance**

1. Sweep or hose down the playground regularly to minimize dirt and debris, which wears down the paint more quickly.
2. Save the extra paint and touch up on an annual basis or as needed.

#### ***Design Tip***

*Be creative and paint lines and curves to make tracks for children to follow.*

*Or cut your own stencil designs out of cardboard!*

## Playground Stencil Request Form

### Borrower Information:

|                        |  |
|------------------------|--|
| Date of Request        |  |
| Organization Name      |  |
| Street Address         |  |
| City and Zip           |  |
| County                 |  |
| Name of Contact Person |  |
| Phone Number           |  |
| Email                  |  |

Please mark below up to 3 stencils you want to borrow. Number your 1<sup>st</sup>, 2<sup>nd</sup> and 3<sup>rd</sup> choice. You may receive all 3 if they are available.
